

Precision, High Speed JFET-Input
 Operational Amplifiers

FEATURES

- Improved Specifications Compared to LF155/156 Devices
- Guaranteed Low Offset Voltage 500 μ V Max.
- Guaranteed Low Offset Drift 5 μ V/ $^{\circ}$ C Max.
- Guaranteed Bias Current Fully Warmed-Up over Temperature
- OP-15: LF156 Speed with LF155 Power Dissipation
 - Guaranteed Supply Current 4mA Max.
 - Guaranteed Slew Rate 10V/ μ s Min.
- OP-16:
 - Guaranteed Faster Slew Rate 18V/ μ s Min.
 - No High Frequency Oscillation at Cold Temperatures
- No Phase Reversal when Negative Common-Mode Limit is Exceeded

2

APPLICATIONS

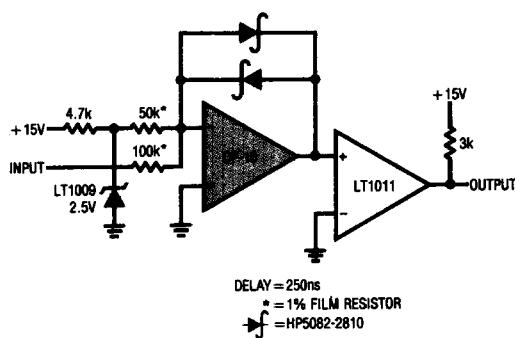

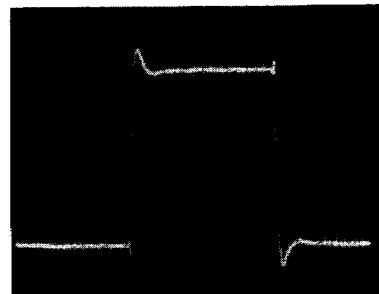

- Long Term Precision Integration
- Current to Voltage Conversion
- Medical Instrumentation—CAT Scanner
- High Speed, Precision Sample and Hold

DESCRIPTION

The OP-15/16 series devices feature distinct advantages over other JFET-input operational amplifiers, in particular compared to LF155/156 types.

The OP-15 has the speed of the LF156 design with the low power dissipation of the slower LF155. The OP-16 is considerably faster. Both devices offer offset voltages as low as 0.5mV, with guaranteed drift of 5 μ V/ $^{\circ}$ C. Input bias current at 125 $^{\circ}$ C is just a few nanoamperes. Other manufacturers' OP-15/16 (and LF155/156) exhibit phase reversal at the output when the negative common-mode limit at the input is exceeded; i.e., driving from -12V to -15V with \pm 15V supplies. This can cause lock-up in servo systems. As shown in the application section, Linear Technology's OP-15/16 does not have this problem due to unique phase reversal protection circuitry.

In addition, Linear's OP-16 is free from high frequency oscillation problems at cold temperatures, as is illustrated in the "Voltage Follower Small Signal Pulse Response" photo. For applications requiring higher performance, see the LT1022, LT1055 and LT1056 data sheets.

Fast, 12-Bit Current Comparator

Voltage Follower Small Signal Pulse Response
 $T_A = -55^{\circ}\text{C}$

$C_L = 100\text{pF}$
 VERTICAL SCALE = 20mV/DIV
 HORIZONTAL SCALE = 0.2 μ s/DIV

ABSOLUTE MAXIMUM RATINGS

Supply Voltage	
A, B, E, F Grades	$\pm 22V$
C, G Grades	$\pm 18V$
Internal Power Dissipation	500mW
Operating Temperature Range	
A, B, C Grades	-55°C to 125°C
E, F, G Grades	0°C to 70°C
Junction Temperature	150°C
Differential Input Voltage	
A, B, E, F Grades	$\pm 40V$
C, G Grades	$\pm 30V$
Input Voltage (Note 4)	
A, B, E, F Grades	$\pm 20V$
C, G Grades	$\pm 16V$
Output Short Circuit Duration	Indefinite
Storage Temperature Range	-65°C to 150°C
Lead Temperature (Soldering, 10 sec.)	300°C

The ● denotes the specifications which apply over full operating temperature range.

For MIL-STD components, please refer to LTC 883C data sheet for test listing and parameters.

Note 1: Input bias current is specified for two different conditions. The T_J specification is with the junction at ambient temperature; the warmed-up specification is with the device operating in a warmed-up condition at the ambient temperature specified. I_B and I_{OS} are measured at $V_{CM} = 0$.

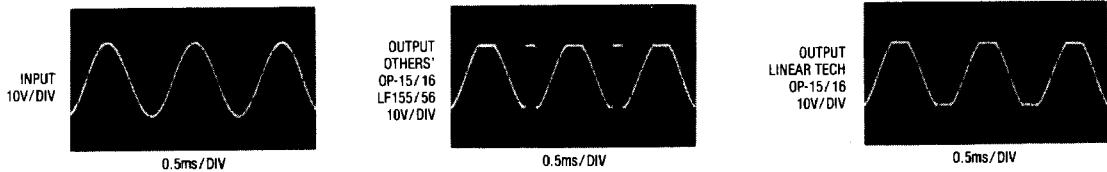

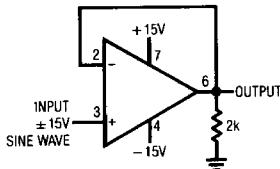

Note 2: Settling time is defined here for a unity gain inverter connection using $2k\Omega$ resistors. It is the time required for the error voltage (the voltage at the inverting input pin on the amplifier) to settle to within a specified percentage of its final value from the time a 10V step input is applied to the inverter.

Note 3: Sample tested.

Note 4: Unless otherwise specified, the absolute maximum negative input voltage is equal to the negative power supply voltage.

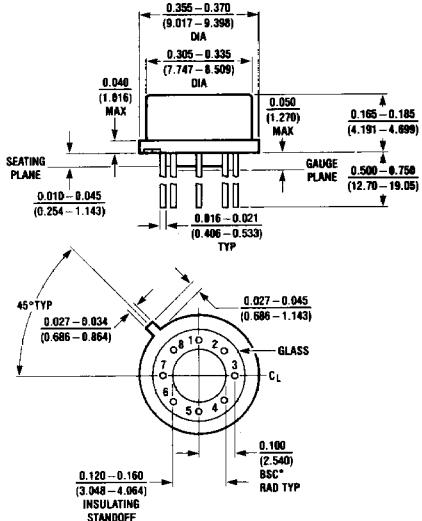

APPLICATIONS

Voltage Follower with Input Exceeding the Negative Common-Mode Range
