# **4. OPERATING INSTRUCTIONS**

#### 4.1 Input signal Function

Pin No	Symbol		Function
			This is the chip select signal. When CS1 = "L" and CS2 = "H," then the chip
1	/CS1		select becomes active, and data/command I/O is enabled.
			When RES is set to "L," the settings are initialized. The reset operation is
2	/RES		performed by the RES signal level.
			This is connect to the least significant bit of the normal MPU address bus,
3	A0	I V	and it determines whether the data bits are data or a command.
		X	A0 = "H": Indicates that D0 to D7 are display data.
			A0 = "L": Indicates that D0 to D7 are control data.
			• When connected to an 8080 MPU, this is active LOW.
			(R/W) This terminal connects to the 8080 MPU WR signal. The signals on
4	WR(R/W)	I	the data bus are latched at the rising edge of the WR signal.
			When connected to a 6800 Series MPU:
			This is the read/write control signal input terminal.
			When R/W = "H": Read. When R/W = "L": Write.
			<ul> <li>When connected to an 8080 MPU, this is active LOW.</li> </ul>
		RD(E) I	(E) This pin is connected to the RD signal of the 8080 MPU, and the
5	RD(E)		ST7565S series data bus is in an output status when this signal is "L".
			<ul> <li>When connected to a 6800 Series MPU, this is active HIGH.</li> </ul>
			This is the 6800 Series MPU enable clock input terminal.
			This is an 8-bit bi-directional data bus that connects to an 8-bit or 16-bit
	D0 to D5		standard MPU data bus. When the serial interface is selected (P/S = "L") :
6~13	D6 (SCL)	I/O	D0 to D5 are set to high impedance.
	D7 (SI)		D6 : the serial clock input (SCL) ; D7 : serial data input (SI) .
			When the chip select is not active, D0 to D7 are set to high impedance.
14	VDD	PS	Shared with the MPU power supply terminal Vcc.
15	VSS	PS	This is a 0V terminal connected to the system GND.
16	VOUT	Ο	DC/DC voltage converter. Connect a capacitor between this terminal and
			VSS.
17	CAP5+	Ο	DC/DC voltage converter. Connect a capacitor between this terminal and
	0/ 11 0 1	•	the CAP1+ terminal.
18	CAP3+	0	DC/DC voltage converter. Connect a capacitor between this terminal and
10		0	the CAP1+ terminal.
19	CAP1-	0	DC/DC voltage converter. Connect a capacitor between this terminal and
19	UAP I-	0	the CAP1- terminal.
		0	DC/DC voltage converter. Connect a capacitor between this terminal and
20	CAP1+ (	0	the CAP1+ terminal.

			the CAP2+ terminal.
22	CAP2-	0	DC/DC voltage converter. Connect a capacitor between this terminal and the CAP2- terminal.
23	CAP4+	0	DC/DC voltage converter. Connect a capacitor between this terminal and the CAP2+ terminal.
24	VRS	PS	This is the internal-output VREG power supply for the LCD power supply voltage regulator.
25~29	V4~V0	PS	This is a multi-level power supply for the liquid crystal drive. The voltage Supply applied is determined by the liquid crystal cell, and is changed through the use of a resistive voltage divided or through changing the impedance using an opamp. Voltage levels are determined based on VDD, and must maintain the relative magnitudes shown below. $V0 \ge V1 \ge V2 \ge V3 \ge V4 \ge VSS$
30	VR	I	Output voltage regulator terminal. Provides the voltage between VDD and V5 through a resistive voltage divider. IRS = "L" : the V5 voltage regulator internal resistors are not used . IRS = "H" : the V5 voltage regulator internal resistors are used .

32	P/S	I	This pin configures the interface to be parallel mode or serial mode. P/S = "H": Parallel data input/output. P/S = "L": Serial data input. When P/S = "L", D0 to D5 must be fixed to "H". /RD (E) and /WR (R/W) are fixed to either "H" or "L". The serial access mode does NOT support read operation.
33	/HPM	I	This is the power control terminal for the power supply circuit for liquid crystal drive. /HPM = "H": Normal mode /HPM = "L": High power mode

# 5. NOTES

#### Safety

• If the LCD panel breaks, be careful not to get the liquid crystal in your mouth. If the liquid crystal touches your skin or clothes, wash it off immediately using soap and plenty of water.

#### <u>Handling</u>

- Avoid static electricity as this can damage the CMOS LSI.
- The LCD panel is plate glass; do not hit or crush it.
- Do not remove the panel or frame from the module.
- The polarizing plate of the display is very fragile; handle it very carefully

#### Mounting and Design

- Mount the module by using the specified mounting part and holes.
- To protect the module from external pressure, leave a small gap by placing transparent plates (e.g. acrylic or glass ) on the display surface, frame, and polarizing plate
- Design the system so that no input signal is given unless the power-supply voltage is applied.
- Keep the module dry. Avoid condensation, otherwise the transparent electrodes may break.

#### <u>Storage</u>

- Store the module in a dark place where the temperature is 25 °C±10 °C and the humidity below 65% RH.
- Do not store the module near organic solvents or corrosive gases.
- Do not crush, shake, or jolt the module (including accessories).

#### **Cleaning**

- Do not wipe the polarizing plate with a dry cloth, as it may scratch the surface.
- Wipe the module gently with soft cloth soaked with a petroleum benzine.
- Do not use ketonic solvents (ketone and acetoe) or aromatic solvents (toluene and xylene), as they may damage the polarizing plate.

### 6. OPERATION PRECAUTIONS

Any changes that need to be made in this specification or any problems arising from it will be dealt with quickly by discussion between both companies.

Quality warranty period: Within one year after shipment date (excluding abnormal usage way and abnormal environments.)
