

TLP2110

1. Applications

- Programmable Logic Controllers (PLCs)
- Battery Management System (BMS)
- Industrial Inverters

2. General

The TLP2110 is a 5-Mbps low-power photocoupler. It has two circuits built into a single SO8 package, which can reduce the mounting area.

The TLP2110 consumes supply current (I_{DDI}/I_{DDH}) of only 0.6 mA maximum over the entire operating temperature range of -40 °C to 125 °C and operates at a supply voltage as low as 2.7 V, contributing to a reduction in power consumption of various systems.

The input forward current can be less than 1 mA maximum, allowing direct drive by a microcontroller.

The detector has a totem-pole output stage with current sourcing and sinking capabilities. The TLP2110 has an internal Faraday shield that provides a guaranteed common-mode transient immunity of ± 25 kV/ μ s.

3. Features

- (1) Package: SO8
- (2) Data transfer rate: 5 MBd (typ.) (NRZ)
- (3) Supply current: 0.6 mA (max)
- (4) Threshold input current: 1.0 mA (max)
- (5) Supply voltage: 2.7 to 5.5 V
- (6) Operating temperature: -40 to 125 °C
- (7) Propagation delay time: 250 ns (max)
- (8) Pulse width distortion: 30 ns (max)
- (9) Isolation voltage: 2500 Vrms (min)
- (10) Safety standards
 - UL-recognized: UL 1577, File No.E67349
 - cUL-recognized: CSA Component Acceptance Service No.5A File No.E67349
 - VDE-approved: EN 60747-5-5 (**Note 1**)

Note 1: When a VDE approved type is needed, please designate the **Option (V4)**.

Note: Using continuously under heavy loads (e.g. the application of high temperature/current/voltage and the significant change in temperature, etc.) may cause this product to decrease in the reliability significantly even if the operating conditions (i.e. operating temperature/current/voltage, etc.) are within the absolute maximum ratings.

Please design the appropriate reliability upon reviewing the Toshiba Semiconductor Reliability Handbook ("Handling Precautions"/"Derating Concept and Methods") and individual reliability data (i.e. reliability test report and estimated failure rate, etc.).

8. Recommended Operating Conditions (Note)

Characteristics	Symbol	Note	Min	Typ.	Max	Unit
Input on-state current	$I_{F(ON)}$	(Note 1), (Note 2)	2	—	6	mA
Input off-state voltage	$V_{F(OFF)}$	(Note 1), (Note 2)	0	—	0.8	V
Supply voltage	V_{DD}	(Note 3)	2.7	3.3 / 5	5.5	V
Operating temperature	T_{opr}	(Note 3)	-40	—	125	°C

Note: The recommended operating conditions are given as a design guide necessary to obtain the intended performance of the device. Each parameter is an independent value. When creating a system design using this device, the electrical characteristics specified in this data sheet should also be considered.

Note: A ceramic capacitor (0.1 μ F) should be connected between pin 8 and pin 5 to stabilize the operation of a high-gain linear amplifier. Otherwise, this photocoupler may not switch properly. The bypass capacitor should be placed within 1 cm of each pin.

Note 1: Each channel

Note 2: The rise and fall times of the input on-current should be less than 0.5 μ s.

Note 3: Denotes the operating range, not the recommended operating condition.

13. Soldering and Storage

13.1. Precautions for Soldering

The soldering temperature should be controlled as closely as possible to the conditions shown below, irrespective of whether a soldering iron or a reflow soldering method is used.

- When using soldering reflow.

The soldering temperature profile is based on the package surface temperature.

(See the figure shown below, which is based on the package surface temperature.)

Reflow soldering must be performed once or twice.

The mounting should be completed with the interval from the first to the last mountings being 2 weeks.

Fig. 13.1.1 An Example of a Temperature Profile When Lead(Pb)-free Solder Is Used

- When using soldering flow
Preheat the device at a temperature of 150 °C (package surface temperature) for 60 to 120 seconds.
Mounting condition of 260 °C within 10 seconds is recommended.
Flow soldering must be performed once.
- When using soldering Iron
Complete soldering within 10 seconds for lead temperature not exceeding 260 °C or within 3 seconds not exceeding 350 °C
Heating by soldering iron must be done only once per lead.

13.2. Precautions for General Storage

- Avoid storage locations where devices may be exposed to moisture or direct sunlight.
- Follow the precautions printed on the packing label of the device for transportation and storage.
- Keep the storage location temperature and humidity within a range of 5 °C to 35 °C and 45 % to 75 %, respectively.
- Do not store the products in locations with poisonous gases (especially corrosive gases) or in dusty conditions.
- Store the products in locations with minimal temperature fluctuations. Rapid temperature changes during storage can cause condensation, resulting in lead oxidation or corrosion, which will deteriorate the solderability of the leads.
- When restoring devices after removal from their packing, use anti-static containers.
- Do not allow loads to be applied directly to devices while they are in storage.
- If devices have been stored for more than two years under normal storage conditions, it is recommended that you check the leads for ease of soldering prior to use.
