### DESCRIPTION

HCF4076B is a monolithic integrated circuit fabricated in Metal Oxide Semiconductor technology available in DIP and SOP packages. HCF4076B is a four bit register consisting of D-TYPE flip-flops that feature three state outputs. Data Disable inputs are provided to control the entry of data into the flip-flops. When both Data

Disable inputs are low, data at the D inputs are loaded into their respective flip-flops on the next positive transition of the clock input. Output Disable inputs are also provided. When the Output Disable inputs are both low, the normal logic states of the four outputs are available to the load. The outputs are disabled independently of the clock by a high logic level at either Output Disable input, and present a high impedance.

When either Output Disable M or N is high, the outputs are disabled (high impedance state) : however sequential operation of the flip-flop is not affected.
