

# User Programmable Micro-Power Voltage Detectors

## General Description

The RT9801A/B is a micro-power voltage detector supervising the power supply voltage level for microprocessors ( $\mu$ P) or digital systems. It provides user programmable threshold levels with 0.1V step ranging from 1.5V to 5V, which covers most digital applications. It features low supply current of 3 $\mu$ A. Selection of  $V_{TH}$  is easily achieved through 3 pins connected to GND,  $V_{DD}$  or floating for different threshold voltage settings. Two versions of threshold voltages, 1.5V to 4V and 2.5V to 5V, which are programmed in factory are offered by customer demands.

The RT9801A/B performs supervisory function by sending out a reset signal whenever the  $V_{DD}$  voltage falls below a preset threshold level. This reset signal will last the whole period before  $V_{DD}$  recovering. Reset signal will release after  $V_{DD}$  is recovered and last for the whole period of Reset Active Time-out period.

RT9801A/B is N-Channel, open-drain output and provided in SOT-23-6 package.
