

APPLICATION NOTE 3686

DS2155 and DS26521 Software Comparison

This application note describes the differences between the DS2155 and DS26521 single-port devices. They each contain a framer and LIU combination for T1, E1, and J1 applications and support both long-haul and short-haul lines. This note contains a complete breakdown of all feature differences and compares the two devices on a register-by-register basis.

Indirect Registers

The DS2155 uses indirect registers for the following 1per-channel functions. The DS26521 uses direct registers for these functions. The DS26521 only uses indirect registers for loading repetitive patterns, up to 512 bytes, in the BERT.

DS2155 Indirect Register Function	DS26521 Direct Register	Comments
Per-channel transmit idle code	TIDR1 to TIDR32	
Per-channel receive idle code	RIDR1 to RIDR24	
BERT transmit channel select	TBCS1 to TBCS4	
Transmit fractional channel select	TGCCS1 to TGCCS4	
Payload error insert channel select	–	Not supported
Transmit hardware signaling channel select	SSIE1 to SSIE4	
BERT receive channel select	RBCS1 to RBCS4	
Receive fractional channel select	RGCCS1 to RGCCS4	
Receive signaling reinsertion channel select	RSI1 to RSI4	
Receive signaling all-ones insertion channel select	T1RSAOI1 to T1RSAOI3	T1 mode

Terminology

Some of the terminology used in the DS26521 data sheet is different from previous T1/E1 data sheets from Dallas Semiconductor. For example, previous data sheets used the acronym RLOS to refer to Receive Loss of Sync. In the DS26521 data sheet, RLOS more correctly refers to Receive Loss of Signal. The table below shows the differences.

Condition	DS26521 Data Sheet	Previous Data Sheets
Loss of in-bound signal	RLOS (R eceive L oss O f S ignal)	RCL (R eceive C arrier L oss)
Loss of synchronization	RLOF (R eceive L oss O f F raming)	RLOS (R eive L oss O f S ynchronization)
In-bound all ones	AIS (A larm I ndication S ignal) T1 and E1 modes	AIS for E1 mode blue alarm for T1 mode
Remote alarm	RAI (R emote A larm I ndication) T1 and E1 modes	RAI for E1 mode yellow alarm for T1 mode

Register Mapping

The DS26521 address map is compatible with the Maxim/Dallas Semiconductor octal framer products, DS26401, the DS26524 Quad SCT, and the DS26528 Octal SCT. (All addresses are shown in hexadecimal in this application note.) The table below shows the register control functions of the framer, LIU, and BERT in the DS26521.

Register Address Ranges (in Hex)

Address Range	Block
0000 – 00EF	Receive framer
00F0 – 00FF	Global registers
0100 – 01EF	Transmit framer
1000 – 1017	LIU
1018 – 101F	Test
1100 – 110F	BERT

Direct Register Mapping

The following registers in the DS2155 can be mapped directly to registers in the DS26521.

DS2155 Address	DS2155 Symbol	DS2155 Register Description	DS26521 Address	DS26521 Symbol
08	SSIE1	Software signaling insertion enable 1	118	SSIE1
09	SSIE2	Software signaling insertion enable 2	119	SSIE2
0A	SSIE3	Software signaling insertion enable 3	120	SSIE3
0B	SSIE4	Software signaling insertion enable 4	121	SSIE4
0C	T1RDMR1	T1 receive digital milliwatt enable register 1	03C	T1RDMWE1
0D	T1RDMR2	T1 receive digital milliwatt enable register 2	03D	T1RDMWE2

DA	TSACR	Transmit Sa bit control register	114	E1TSACR

Bit-Level Mapping

The following registers in the DS2155 do not have direct mapping to registers in the DS26521. The following table shows how to map the individual bits of the DS2155 registers into the individual bits of the DS26521 registers.

***Note:** **NS** = not supported

DS2155 Address	DS2155 Symbol	DS2155 Register Description	DS26521 Bit Location 2155 Bit = 26521 Reg. Bit	Comments

HDLC Controller

The DS26521 has a single HDLC controller that can be mapped to any time slot or to the FDL (T1 mode), or to any combinations of Sa bits (E1 mode). The table below lists the differences between the DS2155's and the DS26521's HDLC function.

	DS2155	DS26521
Number of controllers	2	1
FIFO size	128 Bytes	64 Bytes
Channel assignment	Any combination of channels, facilities data link (FDL) bit stream, any combinations of Sa bits	Any single DS0, facilities data link (FDL) bit stream, any combination of Sa bits
SS7 support	Yes	No

DS2155 Address	DS2155 Symbol	DS2155 Register Description	DS26521 Bit Location 2155 Bit = 26521 Reg. Bit	Comments
31	H1RC	HDLC #1 receive control	0 = NS * 1 = -- 2 = -- 3 = -- 4 = -- 5 = -- 6 = RHC.5 7 = RHC.6	* The DS26521 does not have support for Signaling System 7 (SS7).
32	H2RC	HDLC #2 receive control		Unsupported function in the DS26521.
90	H1TC	HDLC #1 transmit control	0 = THC1.0 1 = THC1.1 2 = THC1.2 3 = THC1.3 4 = THC1.4 5 = THC1.5 6 = THC1.6 7 = THC1.7	
91	H1FC	HDLC #1 FIFO control	0 = RHFC.0 1 = RHFC.1 2 = NS * 3 = THFC.0 4 = THFC.1 5 = NS * 6 = -- 7 = --	* The HDLC FIFO is only 64 bytes deep on the DS26521.

DS2155 Address	DS2155 Symbol	DS2155 Register Description	DS26521 Bit Location 2155 Bit = 26521 Reg. Bit	Comments
92	H1RCS1	HDLC #1 receive channel select 1		The DS26521 uses the RHC register to select the channel to receive HDLC data. The DS26521 can only receive HDLC data in a single DSO channel.
93	H1RCS2	HDLC #1 receive channel select 2		
94	H1RCS3	HDLC #1 receive channel select 3		
95	H1RCS4	HDLC #1 receive channel select 4		
96	H1RTSBS	HDLC #1 receive Time Slot Bits/Sa Bits select	NS	
97	H1TCS1	HDLC #1 transmit channel select 1		The DS26521 uses the THC2 register to select the channel to transmit HDLC data. The DS26521 can only transmit HDLC data in a single DSO channel.
98	H1TCS2	HDLC #1 transmit channel select 2		
99	H1TCS3	HDLC #1 transmit channel select 3		
9A	H1TCS4	HDLC #1 transmit channel select 4		
9B	H1TTSBS	HDLC #1 transmit time- slot bits/Sa bits select	NS	
9C	H1RPBA	HDLC #1 receive packet bytes available	0B5 RHPBA	
9D	H1TF	HDLC #1 transmit FIFO	1B4 THF	
9E	H1RF	HDLC #1 receive FIFO	0B6 RHF	
9F	H1TFBA	HDLC #1 transmit FIFO buffer available	1B3 TFBA	
A0	H2TC	HDLC #2 transmit control		Unsupported function in the DS26521.
A1	H2FC	HDLC #2 FIFO control		Unsupported function in the DS26521.
A2	H2RCS1	HDLC #2 receive channel select 1		Unsupported function in the DS26521.
A3	H2RCS2	HDLC #2 receive channel select 2		Unsupported function in the DS26521.
A4	H2RCS3	HDLC #2 receive channel select 3		Unsupported function in the DS26521.
A5	H2RCS4	HDLC #2 receive channel select 4		Unsupported function in the DS26521.
A6	H2RTSBS	HDLC #2 receive time-slot bits/Sa bits select		Unsupported function in the DS26521.
A7	H2TCS1	HDLC #2 transmit channel select 1		Unsupported function in the DS26521.

DS2155 Address	DS2155 Symbol	DS2155 Register Description	DS26521 Bit Location 2155 Bit = 26521 Reg. Bit	Comments
A8	H2TCS2	HDLC #2 transmit channel select 2		Unsupported function in the DS26521.
A9	H2TCS3	HDLC #2 transmit channel select 3		Unsupported function in the DS26521.
AA	H2TCS4	HDLC #2 transmit channel select 4		Unsupported function in the DS26521.
AB	H2TTSBS	HDLC #2 transmit Time-slot bits/Sa bits select		Unsupported function in the DS26521.
AC	H2RPBA	HDLC #2 receive packet bytes available		Unsupported function in the DS26521.
AD	H2TF	HDLC #2 transmit FIFO		Unsupported function in the DS26521.
AE	H2RF	HDLC #2 Receive FIFO		Unsupported function in the DS26521.
AF	H2TFBA	HDLC #2 transmit FIFO buffer available		Unsupported function in the DS26521.

BERT Functions

The DS26521 BERT functions are more full featured than on the DS2155, so direct register mapping is not possible. The DS26521 pseudorandom patterns are fully programmable over 32 bits, compared to the fixed set of pseudorandom patterns found in the DS2155. Also, large repetitive patterns up to 512 bytes can be loaded with an indirect register. The BERT register set for the DS2155 is shown below, but the DS26521 data sheet should be consulted for all BERT functions.

DS2155 Address	DS2155 Symbol	DS2155 Register Description	Comments
DB	BAWC	BERT alternating word count Rate	Consult DS26521 data sheet
DC	BRP1	BERT repetitive pattern Set register 1	Consult DS26521 data sheet
DD	BRP2	BERT repetitive pattern Set register 2	Consult DS26521 data sheet

Features Exclusive to the DS26521

There are many new functions in the DS26521.

Transmit Side Synchronizer

The DS26521 has a basic synchronizer on the transmit side. This function allows the transmitter to align to the data stream present at TSER when there is no externally supplied frame sync signal available.

Register name: **TSYNCC**
Register description: **Transmit Synchronizer Control Register**
Register address: **18EH**

7	6	5	4	3	2	1	0
--	--	--	--	CRC4	TSEN	SYNCE	RESYNC
0	0	0	0	0	0	0	0

Bit 2 - Transmit Synchronizer Enable (TSEN)

- 0 = Transmit-side synchronizer disabled
- 1 = Transmit-side synchronizer enabled

Bit 3 - CRC4 Enable (RCRC4). E1 Mode Only

- 0 = Do not search for the CRC4 multiframe word
- 1 = Search for the CRC4 multiframe word

Register name: **TLS3**
Register description: **Transmit Latched Status Register 3 (Synchronizer)**
Register address: **192H**

7	6	5	4	3	2	1	0
--	--	--	--	--	--	LOF	LOFD
0	0	0	0	0	0	0	0

Bit 0 – Loss-of-Frame Synchronization Detect (LOFD)

This is a latched bit which is set when the transmit synchronizer is searching for the sync pattern in the incoming data stream.

Bit 1 - Loss of Frame (LOF)

A real-time status bit that indicates that the transmit-side synchronizer is searching for the synchronization pattern in the incoming data stream.

Other Functions Exclusive to the DS26521

Register name: **GTCR1**
Register description: **Global Transceiver Control Register 1**
Register address: **0F0H**
Read/write function: **R/W**

7	6	5	4	3	2	1	0
--	--	RLOFLTS	GIBOE	--	--	GCLE	GIPI
0	0	0	0	0	0	0	0

Bit 0 - Global Interrupt Pin Inhibit (GIPI)

0 = Normal operation. Interrupt pin (INT) will toggle low on an unmasked interrupt condition.
1 = Interrupt inhibit. Interrupt pin (INT) is forced high (inactive) when this bit is set.

Bit 1 - Global Counter Latch Enable (GCLE)

A low-to-high transition on this bit will, when enabled, latch the framer performance monitor counters. Each framer can be independently enabled to accept this input. This bit must be cleared and set again to perform another counter latch.

Bit 4 - Ganged IBO Enable (GIBOE)

This bit is used to select either the internal mux for IBO operation or an external "wire-OR" operation. Usually, this bit should be set = 0 and the internal mux used.
0 = Use internal IBO mux.
1 = Externally wire-OR. TSERs and RSERs for IBO operation.

Bit 5 – Receive Loss of Frame/Loss of Transmit Clock Indication Select (RLOFLTS)

0 = RLOF/LOTcx pins indicate framer receive loss of frame.
1 = RLOF/LOTcx pins indicate framer loss of transmit clock.

Register name: **GFCR**
Register description: **Global Framer Control Register**
Register address: **0F1H**
Read/write function: **R/W**

7	6	5	4	3	2	1	0
--	--	BPCLK1	BPCLK0	RFLOSSFS	RFMSS	TCBCS	RCBCS
0	0	0	0	0	0	0	0

Bit 0 - Receive Channel Block/Clock Select (RCBCS)

This bit controls the function of all eight RCHBLK/CLK pins.
0 = RCHBLK/CLK pins output RCHBLK (1-8) (Receive Channel Block)
1 = RCHBLK/CLK pins output RCHCLK (1-8) (Receive Channel Clock)

Bit 1- Transmit Channel Block/Clock Select (TCBCS)

This bit controls the function of all eight TCHBLK/CLK pins.
0 = TCHBLK/CLK pins output TCHBLK (1-8) (Transmit Channel Block)
1 = TCHBLK/CLK pins output TCHCLK (1-8) (Transmit Channel Clock)

Bit 2 - Receive Frame/Multiframe Sync Select (RFMSS)

This bit controls the function of all eight RM/RFSYNC pins.
0 = RM/RFSYNC pins output RFSYNC (1-8) (Receive Frame Sync)
1 = RM/RFSYNC pins output RMSYNC (1-8) (Receive Multi-Frame Sync)

Bit 3 - Receive Loss of Signal / Signaling Freeze Select (RLOSSFS)

This bit controls the function of all eight AL/RSIGF/FLOS pins. The Receive LOS is further selected between Framer LOS and LIU LOS by GTCR2 Bit 2.
0 = AL/RSIGF/FLOS pins output RLOS (1-8) (Receive Loss)
1 = AL/RSIGF/FLOS pins output RSIGF (1-8) (Receive Signaling Freeze)

Register name: **GTCR2**
 Register description: **Global Framer Control Register**
 Register address: **0F2H**
 Read/write function: **R/W**

7	6	5	4	3	2	1	0
--	--	--	--	--	LOSS	TSSYNIOSEL	--
0	0	0	0	0	0	0	0

Bit 1 - Transmit System Synchronization I/O Select (TSSYNIOSEL)

If this bit is set to a 1, the TSSYNCIO is an 8kHz output synchronous to the BPCLK. This “frame pulse” can be used in conjunction with the backplane clock to provide IBO signals for a system backplane. If this bit is reset, TSSYNCIO is an input. An 8kHz frame pulse is required for transmit synchronization and IBO operation.

Bit 2 - LOS Selection (LOSS)

If this bit is set, the AL/RSIGF/FLOS pins can be driven with LIU loss and if reset by framer LOS . The selection of whether to drive AL/RSIGF/FLOS pins with LOS (analog or digital) or signaling freeze is controlled by GFCR bit 2. This selection affects all ports.

Register name: **GTCCR**
 Register description: **Global Transceiver Clock Control Register**
 Register address: **0F3H**
 Read/write function: **R/W**

7	6	5	4	3	2	1	0
BPREFSEL3	BPREFSEL2	BPREFSEL1	BPREFSEL0	BFREQSEL	FREQSEL	MPS1	MPS0
0	0	0	0	0	0	0	0

Bit 2 - Frequency Selection (FREQSEL)

In conjunction with the MPS[1:0] bits, selects the external MCLK frequency of the signal input at the MCLK pin of the DS26521.

0 = The external master clock is 2.048MHz or a multiple thereof.

1 = The external master clock is 1.544MHz or a multiple thereof.

Bit 3 – Backplane Frequency Select (BFREQSEL)

In conjunction with BPRFSEL[3:0] identifies the reference clock frequency used by the DS26521 backplane clock-generation circuit. Note that the setting of this bit should match the T1E1 selection for the LIU whose recovered clock is being used to generate the backplane clock.

0 = Backplane reference clock is 2.048MHz.

1 = Backplane reference clock is 1.544MHz.

Bit 7 to 4 - Backplane Clock Reference Selects (BPREFSEL[3:0])

These bits select which reference clock source will be used for BPCLK generation. The BPCLK can be generated from any of the LIU recovered clocks, an external reference, or derivatives of MCLK input. Consult the DS26521 datasheet for details.

Register name: **GLSRR**
 Register description: **Global LIU Software Reset Register**
 Register address: **0F5H**
 Read/write function: **R/W**

7	6	5	4	3	2	1	0
--	--	--	--	--	--	--	LSRST1
0	0	0	0	0	0	0	0

Bit 0 - Channel 1 LIU Software Reset (LSRST1)

LIU logic and registers are reset with a 0-to-1 transition in this bit. The reset is released when a zero is written to this bit.

0 = Normal operation

1 = Reset LIU

Register name: **GFSRR**
 Register description: **Global Framer and BERT Software Reset Register**
 Register address: **0F6H**
 Read/write function: **R/W**

7	6	5	4	3	2	1	0
--	--	--	--	--	--	--	FSRST1
0	0	0	0	0	0	0	0

Bit 0 - Channel 1 Framer and BERT Software Reset (FSRST1)

Framer logic and registers are reset with a 0-to-1 transition in this bit. The reset is released when a zero is written to this bit.

0 = Normal operation

1 = Reset Framer and BERT

Register name: **GFISR**
 Register description: **Global Framer Interrupt Status Register**
 Register address: **0F9H**
 Read/write function: **R**

7	6	5	4	3	2	1	0
--	--	--	--	--	--	--	FIS1
0	0	0	0	0	0	0	0

The GFISR register reports the framer interrupt status for the T1/E1 framer. A logic one in the associated bit location indicates a framer has set its interrupt signal.

Bit 0 : Framer Interrupt Status 1(FIS1).

0 = Framer 1 has not issued an interrupt.

1 = Framer 1 has issued an interrupt.

Register name: **GBISR**
 Register description: **Global BERT Interrupt Status Register**
 Register address: **0FAH**
 Read/write function: **R**

7	6	5	4	3	2	1	0
--	--	--	--	--	--	--	BIS1
0	0	0	0	0	0	0	0

Bit 0 - BERT Interrupt Status 1 (BIS1)

0 = BERT 1 has not issued an interrupt.

1 = BERT 1 has issued an interrupt.

Register name: **GLISR**
 Register description: **Global LIU Interrupt Status Register**
 Register address: **0FBH**

Read/write function: **R**

7	6	5	4	3	2	1	0
--	--	--	--	--	--	--	LIS1
0	0	0	0	0	0	0	0

Bit 0 - LIU Interrupt Status 1 (LIS1)

0 = LIU 1 has not issued an interrupt.

1 = LIU 1 has issued an interrupt.

Register name: **GFIMR**
Register description: **Global Framer Interrupt Mask Register**
Register address: **0FCH**
Read/write function: **R/W**

7	6	5	4	3	2	1	0
--	--	--	--	--	--	--	FIM 1
0	0	0	0	0	0	0	0

Bit 0 - Framer 1 Interrupt Mask (FIM1)

0 = Interrupt masked.

1 = Interrupt enabled.

Register name: **GBIMR**
Register description: **Global BERT Interrupt Mask Register**
Register address: **0FDH**
Read/write function: **R/W**

7	6	5	4	3	2	1	0
--	--	--	--	--	--	--	BIM 1
0	0	0	0	0	0	0	0

Bit 0 - BERT Interrupt Mask 1 (BIM1)

0 = Interrupt masked.

1 = Interrupt enabled.

Register name: **GLIMR**
Register description: **Global LIU Interrupt Mask Register**
Register address: **0FEH**
Read/write function: **R/W**

7	6	5	4	3	2	1	0
--	--	--	--	--	--	--	LIM 1
0	0	0	0	0	0	0	0

Bit 0 - LIU Interrupt Mask 1 (LIM1)

0 = Interrupt masked.

1 = Interrupt enabled.

Register name: **T1RCR2**
Register description: **Receive Control Register 2**
Register address: **014H**

7	6	5	4	3	2	1	0
---	---	---	---	---	---	---	---

--	--	--	RSLC96	OOF2	OOF1	RAIIE	RD4RM
0	0	0	0	0	0	0	0

Bit 1 - Receive RAI Integration Enable (RAIIE)

The ESF RAI indication can be interrupted for a period not to exceed 100ms per interruption (T1.403). In ESF mode, setting RAIIE causes the RAI status from the DS26521 to be integrated for 200ms.

0 = RAI detects when 16 consecutive patterns of 00FF appear in the FDL.

RAI clears when 14 or fewer patterns of 00FF hex out of 16 possible appear in the FDL

1 = RAI detects when the condition has been present for greater than 200ms.

RAI clears when the condition has been absent for greater than 200ms.

Register name: **RCR3**
Register description: **Receive Control Register 3**
Register address: **083H**

7	6	5	4	3	2	1	0
IDF	--	RSERC	--	--	--	PLB	FLB
0	0	0	0	0	0	0	0

Bit 7 - Input Data Format (IDF)

0 = Bipolar data is expected at RPOS and RNEG (either AMI or B8ZS)

1 = NRZ data is expected at RPOS. The BPV counter will be disabled and RNEG will be ignored by the DS26521.

Register name: **RRTS1**
Register description: **Receive Real Time Status Register 1**
Register address: **0B0H**

7	6	5	4	3	2	1	0
--	--	--	--	RRAI	RAIS	RLOS	RLOF
0	0	0	0	0	0	0	0

Bit 0 - Receive Loss of Frame Condition (RLOF)

Set when the DS26521 is not synchronized to the received data stream.

Bit 1 - Receive Loss of Signal Condition (RLOS)

Set when 255 (or 2048 if RCR2.0 = 1) consecutive zeros have been detected at RPOS and RNEG.

Bit 2 - Receive Alarm Indication Signal Condition (RAIS)

Set when an unframed all-ones code is received at RPOS and RNEG.

Bit 3 - Receive Remote Alarm Indication Condition (RRAI)

Set when a remote alarm is received at RPOS and RNEG.

Register name: **RRTS3 -T1 Mode**
 Register description: **Receive Real Time Status Register 3**
 Register address: **0B2H**

7	6	5	4	3	2	1	0
--	--	--	--	LORC	LSP	LDN	LUP
0	0	0	0	0	0	0	0

Bit 0 - (T1 MODE) Loop-Up Code Detected Condition (LUP)

Set when the loop-up code as defined in the RUPCD1/2 register is being received.

(E1 MODE) Receive Distant MF Alarm Condition (RDMA)

Set when bit-6 of timeslot 16 in frame 0 has been set for two consecutive multiframes. This alarm is not disabled in the CCS signaling mode.

Bit 1 - (T1 MODE) Loop-Down Code Detected Condition (LDN)

Set when the loop-down code as defined in the RDNCD1/2 register is being received.

(E1 MODE) V5.2 Link Detected Condition (V52LNK)

Set on detection of a V5.2 link identification signal (G.965).

Bit 2 - Spare Code Detected Condition (LSP)

Set when the spare code as defined in the RSCD1/2 registers is being received.

Bit 3 - Loss of Receive Clock Condition (LORC)

Set when the RCLK pin has not transitioned for one channel time.

Register name: **RLS4**
 Register description: **Receive Latched Status Register 4**
 Register address: **093H**

7	6	5	4	3	2	1	0
RESF	RESEM	RSLIP	--	RSCOS	1SEC	TIMER	RMF
0	0	0	0	0	0	0	0

RLS4.2 – One-Second Timer (1SEC)

Set every 1s interval, based on RCLK.

Register name: **RLS7 – T1 Mode**
 Register description: **Receive Latched Status Register 7**
 Register address: **096H**

7	6	5	4	3	2	1	0
--	--	RRAI-CI	RAIS-CI	RSLC96	RFDLF	BC	BD
0	0	0	0	0	0	0	0

Bit 3 - Receive SLC-96 Alignment Event (RSLC96)

Set when a valid SLC-96 alignment pattern is detected in the Fs bit stream, and the RSLCx registers have data available for retrieval. (Section 11.12)

Bit 5 - Receive RAI-CI Detect (RRAI-CI)

Set when an RAI-CI pattern has been detected by the receiver (see Section 11.5.1). This bit is active in ESF framing mode only, and will set only if an RAI condition is being detected (RRTS1.3). When the host reads (and clears) this bit, it will set again each time the RAI-CI pattern is detected (approximately every 1.1 seconds).

Register name: **ERCNT**
 Register description: **Error Counter Configuration Register**
 Register address: **086H**

7	6	5	4	3	2	1	0
1SECS	MCUS	MECU	ECUS	EAMS	FSBE	MOSCRF	LCVCRF
0	0	0	0	0	0	0	0

Bit 6 - Manual Counter Update Select (MCUS)

When manual update mode is enabled with EAMS, this bit can be used to allow the GLCE bit in GCR1 to latch all counters. This is useful for synchronously latching counters of multiple framers.

0 = MECU is used to manually latch counters.

1 = GLCE is used to manually latch counters.

Bit 7 – One-Second Select (1SECS)

When timed update is enabled by EAMS, setting this bit for a specific framer will allow that framer's counters to latch on the 1s reference from framer #1. Note that this bit should always be clear for framer #1.

0 = Use internally generated 1s timer.

1 = Use 1s timer from framer #1.

Register name: **RESCR**
 Register description: **Receive Elastic Store Control Register**
 Register address: **085H**

7	6	5	4	3	2	1	0
RDATFMT	RGCLKEN	-	RSZS	RESALGN	RESR	RESMDM	RESE
0	0	0	0	0	0	0	0

Bit 4 - Receive Slip Zone Select (RSZS)

This bit determines the minimum distance allowed between the elastic store read and write pointers before forcing a controlled slip. This bit is only applies during T1-to-E1 or E1-to-T1 conversion applications.

0 = Force a slip at 9 bytes or less of separation (used for clustered blank channels)

1 = Force a slip at 2 bytes or less of separation (used for distributed blank channels)

Register name: **T1RBOCC**
 Register description: **Receive BOC Control Register**
 Register address: **015H**

7	6	5	4	3	2	1	0
RBR	--	RBD1	RBD0	--	RBF1	RBF0	-
0	0	0	0	0	0	0	0

Bit 5, 4 - Receive BOC Disintegration Bits (RBD[1:0])

The BOC disintegration filter sets the number of message bits that must be received without a valid BOC in order to set the BC bit indicating that a valid BOC is no longer being received.

RBD1	RBD0	Consecutive message bits for BOC clear identification
0	0	16
0	1	32
1	0	48
1	1	64

Register name: **TIOCR**
 Register description: **Transmit I/O Configuration Register**
 Register address: **184H**

7	6	5	4	3	2	1	0
TCLKINV	TSYNCINV	TSSYNCINV	TSCLKM	TSSM	TSIO	TSDW	TSM
0	0	0	0	0	0	0	0

Bit 3 - TSSYNC Mode Select (TSSM)

Selects frame or multiframe mode for the TSSYNC pin.

0 = frame mode

1 = multiframe mode

Register name: **TLS1**
 Register description: **Transmit Latched Status Register**
 Register address: **190H**

7	6	5	4	3	2	1	0
TESF	TESEM	TSLIP	TSLC96	TPDV	TMF	LOTCC	LOTCL
0	0	0	0	0	0	0	0

Bit 4 – (T1 Mode Only) Transmit SLC96 Multiframe Event (TSLC96)

When enabled by TCR2.6, this bit sets once per SLC96 multiframe (72 frames) to alert the host that new data might be written to the TSLC1-TSLC3 registers.

Register name: **TESCR**
Register description: **Transmit Elastic Store Control Register**
Register address: **185H**

7	6	5	4	3	2	1	0
TDAFMT	TGCLKEN	--	TSZS	TESALGN	TESR	TESMDM	TESE
0	0	0	0	0	0	0	0

Bit 4 - Transmit Slip Zone Select (TSZS)

This bit determines the minimum distance allowed between the elastic store read and write pointers before forcing a controlled slip. This bit only affects the elastic stores when used in T1-to-E1 or E1-to-T1 conversion applications.

0 = force a slip at 9 bytes or less of separation (used for clustered blank channels)

1 = force a slip at 2 bytes or less of separation (used for distributed blank channels)

Conclusion

This application note shows the differences between the DS2155 and the DS26521 transceivers. It presents the terminology, the register mapping, and the features exclusive to the DS26521.
