

AR6000

Alternator regulator with LIN

Rev. 5.2 — 17 June 2019

Product data sheet

1 General description

The AR6000 is an integrated circuit intended to regulate the output voltage of an automotive alternator.

It supplies a current via a high-side MOSFET to the excitation coil of the alternator and provides an internal freewheeling diode. It keeps the battery at its nominal charge and delivers current to electrical devices within the vehicle.

The IC provides a load response control mechanism (LRC), and has an interface for the industry standard LIN protocol (v 1.3 or 2.1) to allow an ECU to control the regulated voltage and the LRC rate among other parameters. The ECU can also read back information about the status of the regulator and the alternator via LIN.

It can be programmed for most functions using OTP (fuses) and fits a large number of alternators and applications.

2 Simplified application diagram

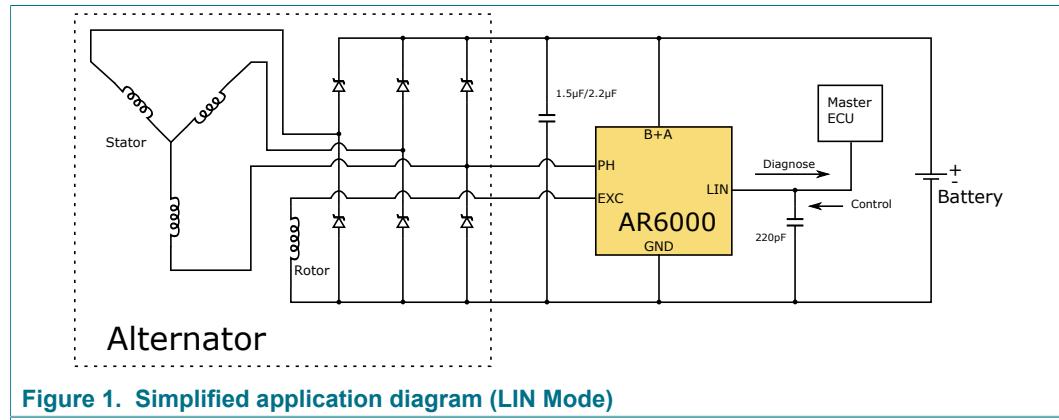

Figure 1. Simplified application diagram (LIN Mode)

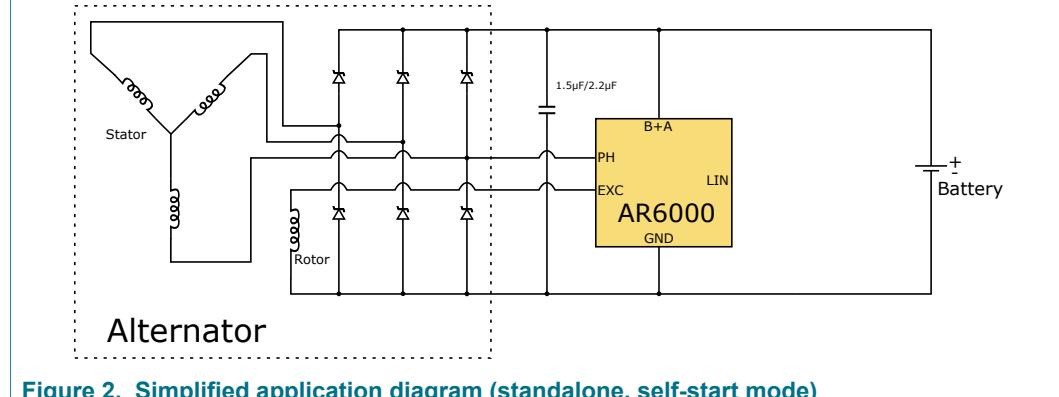

Figure 2. Simplified application diagram (standalone, self-start mode)

3 Features and benefits

- High-side field driver
- Internal freewheeling diode
- Up to 12.0 A rotor current (excitation coil)
- Load response control (LRC) and return LRC
- Current limitation and overcurrent protection
- Thermal protection
- Thermal compensation
- LIN 2.1 physical layer
- Set point voltage selectable from 10.6 V to 16 V
- Accurate rotor current measurement, die temperature, alternator speed, and battery voltage reported by LIN

4 Applications

- Automotive alternators

5 Orderable parts

Table 1. Orderable part variations

Part number	Temperature (T_A)	Package
MC33AR6000BGWS ^[1]	-40 °C to +150 °C	die
MC33AR6000BGT ^[1]	-40 °C to +125 °C	TO220

[1] The AR6000 devices are configurable with one time programmable (OTP) options described in [Table 58](#). For easy design-in, contact your local NXP sales representative to receive limited engineering samples in the TO-220 package configured to your system requirements.

7.2 Pin definitions

A functional description of each pin can be found in [Section 9.2 "Functional pin description"](#).

Table 3. Pin description

Pin number	Pin name	Pin function	Formal name	Definition
1	EXC	output	excitation	this pin is connected to the rotor coil of the alternator
2	B+A	power	supply voltage	this pin is connected to the battery of the vehicle
3	GND	power	ground	ground pin
4	BUS	input/output	LIN-bus	LIN-bus connected to master
5	PH	input	phase	signal from alternator phase

Table 4. Mandatory external components

Data	Description	Min.	Typ.	Max.	Unit
B+A capacitor	—	—	1.5	—	µF
LIN-bus capacitor	—	—	220	—	pF

8 General product characteristics

8.1 Maximum ratings

Table 5. Maximum ratings

All voltages are with respect to ground, unless otherwise noted. Exceeding these ratings may cause a malfunction or permanent damage to the device. $T_A = 25^\circ\text{C}$, unless otherwise stated.

Symbol	Description (Rating)	Min.	Max.	Unit	
ELECTRICAL RATINGS					
$V_{B+A \text{ MAX}}$	B+A supply pin DC voltage Load dump transient voltage (ISO7637-2) DC voltage	—	40	V	
$V_{B+A \text{ MIN}}$	—	—	-0.3	V	
$V_{B+A \text{ REV}}$	Maximum reverse B+A voltage (5 seconds)	[1]	—	-3.2	V
I_{EXC}	Maximum excitation current	[2]	—	12	A
	Recirculation diode peak current	—	12	A	
	Recirculation diode reverse voltage	—	+40	V	
V_{PHASE}	PHASE input voltage range	—24	+40	V	
	BUS pin input range	—2.0	+40	V	
$V_{\text{ESD}1}$	ESD voltage Human Body Model - All pins (MIL std 883C)	[3]	—	±8000	V
$V_{\text{ESD}2}$	CDM- AECQ100-011B All pins	[4]	—	±500	
$V_{\text{ESD}3}$	CDM- AECQ100-011B EXC and Phase pins	—	—	±750	
$V_{\text{ESD}4}$	Accessible pins (EN61.000-4-2) when mounted on the Alternator (BUS & B+A) by contact discharge	[5]	—	±10000	
$V_{\text{ESD}5}$	Air discharge when mounted on the Alternator	—	—	±15000	

Symbol	Description (Rating)	Min.	Max.	Unit
Level	Standard Transient Pulses ISO 7637-2 (when mounted on alternator)			
	Pulse 1	—	-100	
	Pulse 2a	—	+100	
	Pulse 3a	—	-150	
	Pulse 3b	—	+100	

- [1] Not tested. Depends on package and bonding.
 [2] Time to withstand this current before thermal shutdown depends on thermal characteristics of the package and ambient temperature.
 [3] Testing is performed in accordance with the Human Body Model (CZAP = 100 pF, RZAP = 1500 Ω).
 [4] Testing is performed in accordance with the Charge Device Model, Robotic (CZAP = 4.0 pF and 30 pF).
 [5] Testing is performed in accordance with the EN61000-4-2 specification (CZAP = 150 pF, RZAP = 330 Ω) on unpowered product, (CZAP = 330 pF, RZAP = 330 Ω) on powered product.

8.2 Thermal characteristics

Table 6. Thermal ratings

Exceeding these ratings may cause a malfunction or permanent damage to the device.

Symbol	Description (Rating)	Min.	Max.	Unit
THERMAL RATINGS				
T _{STOR}	Storage temperature	-45	+150	°C
T _J	Operating junction temperature	-40	+150 ^[1]	°C
T _{J-TSD}	Thermal shutdown temperature	170	—	°C
T _{TSD-HYST}	Thermal shutdown hysteresis	—	10	°C

- [1] Operation is guaranteed by design up to T_{J-TSD}.

8.3 Static electrical characteristics

Table 7. Static electrical characteristics

Electrical parameters are tested at die level at 30 °C and 140 °C. Typical values noted reflect the approximate parameter mean at T_A = 25 °C under nominal conditions, unless otherwise noted. Parametric values guaranteed from T_J = -40 °C to +150 °C, unless otherwise noted. Operation is guaranteed by design up to T_{J-TSD}.

Symbol	Characteristic	Min.	Typ.	Max.	Unit	
V _{B+A}	Operating voltage, V _{B+A}	[1]	5.0	—	16.5	V
V _{BUS}	Bus operating voltage (LIN)	8.0	—	18	V	
I _{SB25}	Standby current at 25 °C, at V _{B+A} = 12.8 V (Phase at 0 V, V _{LIN} = V _{B+A})	—	60	75	μA	
I _{SB150}	Standby current at 150 °C, at V _{B+A} = 12.8 V (Phase at 0 V, V _{LIN} = V _{B+A})	—	80	130	μA	
I	Standby current In pre wake-up mode at 25 °C	—	—	130	μA	
I _{OP}	Operating current no EXC Load at 25 °C and V _{B+A} = 13 V	—	—	18	mA	
V _{REG}	Range of regulation voltage (50 % DC)	10.60	—	16	V	
ΔV _{REG1}	V _{REG} setting accuracy voltage at 50 % for V _{REG} = 13.8 V at T _J = 25 °C (die version), at T _J = 125 °C (TO220 version), based on test results at 25 °C and 150 °C	-100	—	+100	mV	
ΔV _{REG2}	V _{REG} setting accuracy voltage Total variation with respect to real target voltage	-250	—	+250	mV	
V _{OS_MAX}	Overshoot threshold	16.5	—	—	V	

Symbol	Characteristic	Min.	Typ.	Max.	Unit
V _{LOW}	Low-voltage threshold	[2]	8.55	—	V
R _{DS.ON.EXC}	R _{DS.ON} FIELD TMOS at T _J = 150 °C (for V _{B+A} > 7.0 V)	[3]	—	100	mΩ
V _F	Recirculation diode voltage at 5.0 A (Excitation current)	—	1.2	1.5	V
V _{OV}	Safety function	16.2	16.5	16.8	V
I _{EXC-SC}	EXC short-circuit protection threshold	[2]	8.0	10	A
LIN INTERFACE (Parameters refer to LIN Physical Layer Spec Revision 2.1)					
I _{BUS_LIM}	Current limitation for driver dominant state, driver on V _{BUS} = 18 V	—	62	150	mA
I _{BUS_PAS_DOM}	Input leakage current at the receiver. Dominant state (Driver OFF, V _{BAT} = 12 V, V _{BUS} = 0 V)	-1.0	—	—	mA
I _{BUS_PAS_REC}	Input leakage current at the receiver. Recessive state (Driver OFF, 8.0 V < V _{BAT} < 18 V, 8.0 V < V _{BUS} < 18 V, V _{BUS} > V _{BAT})	—	—	20	μA
I _{BUS_NO_GND}	Ground disconnection. GND = V _{SUP} , 0 V < V _{BUS} < 18 V, V _{BAT} = 12 V. Loss of local GND does not affect communication in the residual network	-1.0	—	+1.0	mA
I _{BUS_NO_BAT}	V _{BAT} disconnection. V _{SUP} = GND, 0 V < V _{BUS} < 18 V. Node sustains the current that can flow under this condition. LIN-bus remains operational	—	—	100	μA
V _{BUS_DOM}	Receiver dominant state	—	—	0.4V _{SUP}	V
V _{BUS_REC}	Receiver recessive state	0.6V _{SUP}	—	—	V
V _{BUS_CNT}	V _{BUS_CNT} = (V _{TH_REC} + V _{TH_DOM}) / 2	0.475V _{SUP}	—	0.525V _{SUP}	V
V _{HYST}	V _{HYST} = V _{TH_REC} - V _{TH_DOM}	—	—	0.175V _{SUP}	V
R _{SLAVE}	Pull-up resistor	20	—	60	kΩ
C _{LIN}	Internal capacitor	—	—	30	pF

[1] All parameters are tested at V_{BAT} = 16.5 V, except for overvoltage, safety function and LIN tests.

[2] Threshold is selectable by fuse, see [Table 58](#).

[3] The thermal capability of the packaging is critical to the full use of the output drive.

8.4 Dynamic electrical characteristics

Table 8. Dynamic electrical characteristics

Electrical parameters are tested at die level at 30 °C and 140 °C. Typical values noted reflect the approximate parameter mean at T_A = 25 °C under nominal conditions, unless otherwise noted. Parametric values guaranteed from T_J = -40 °C to +150 °C, unless otherwise noted. Operation is guaranteed by design up to T_{J-TSD}.

Symbol	Characteristic	Min.	Typ.	Max.	Unit
F _{REG}	Regulation frequency	170	200	230	Hz
T _{DEFECT}	Fault qualification delay/filter	[1]	400	—	ms
D _C _{MIN}	Minimum duty cycle	—	—	5	%
E _X _{PREEXC}	Start-up duty cycle (Pre-excitation)	[2]	5	12.5	%
N _{START}	Minimum alternator speed measured to start regulation (if peak to peak value of phase input voltage exceeds 800 mV (typ.))	504	560	616	RPM
N _{HYST}	Hysteresis in speed between start and stop of regulation	50	100	150	RPM
ΔLRC	Delta LRC duty cycle	—	3.125	—	%

Symbol	Characteristic	Min.	Typ.	Max.	Unit
LIN INTERFACE (Parameters refer to LIN Physical Layer Spec Revision 2.1)					
TOL_CLK	Lin controller clock (4 MHz relaxation oscillator) Clock overall tolerance	-10	—	+10	%
F_TOL_SYNC	Bit rate tolerance Deviation of slave node bit rate relative to the master node bit rate after synchronization	—	—	2	%
t_BFS	Value of accuracy of the byte field detection	—	—	2/16	Tbit
t_EBS	Earliest bit sample time, $t_{EBS} \leq t_{LBS}$	7/16	—	—	Tbit
t_LBS	Latest bit sample time, $t_{EBS} \geq t_{LBS}$	—	—	10/16Tbit - t_BFS	Tbit
D1 Valid for 20 kBaud	Duty cycle D1 $TH_{REC(max)} = 0.744 \times V_{SUP}$, $TH_{DOM(max)} = 0.581 \times V_{SUP}$ $V_{SUP} = 7.0 \text{ V to } 18 \text{ V}, t_{BIT} = 50 \mu\text{s}$ $D1 = t_{BUS - rec(min)} / (2t_{BIT})$	0.396	—	—	%
D2 Valid for 20 kBaud	Duty cycle D2 $TH_{REC(min)} = 0.422 \times V_{SUP}$, $TH_{DOM(min)} = 0.284 \times V_{SUP}$ $V_{SUP} = 7.6 \text{ V to } 18 \text{ V}, t_{BIT} = 50 \mu\text{s}$ $D2 = t_{BUS - rec(max)} / (2t_{BIT})$	—	—	0.581	%
D3 Valid for 10.4 kBaud	Duty cycle D3 $TH_{REC(max)} = 0.778 \times V_{SUP}$, $TH_{DOM(max)} = 0.616 \times V_{SUP}$ $V_{SUP} = 7.0 \text{ V to } 18 \text{ V}, t_{BIT} = 96 \mu\text{s}$ $D3 = t_{BUS - rec(min)} / (2t_{BIT})$	0.417	—	—	%
D4 Valid for 10.4 kBaud	Duty cycle D4 $TH_{REC(min)} = 0.389 \times V_{SUP}$, $TH_{DOM(min)} = 0.251 \times V_{SUP}$ $V_{SUP} = 7.6 \text{ V to } 18 \text{ V}, t_{BIT} = 96 \mu\text{s}$ $D4 = t_{BUS - rec(max)} / (2t_{BIT})$	—	—	0.59	%
t_RX_PD	Receiver propagation delay ($T_{RX_PD} = \text{MAX}(t_{REC_PDR}, t_{REC_PDF})$) (internal timing, from physical layer to data layer logic)	—	—	6	μs
T_RX_SYM	Symmetry of receiver propagation delay ($T_{RX_SYM} = t_{REC_PDF} - t_{REC_PDR}$)	-2	—	+2	μs

[1] A fault has to be present for the whole of this time before it is considered valid. Four different deglitching times are selectable by fuse, see [Table 58](#).

[2] This parameter is selectable by fuse.

9 Functional description

9.1 Introduction

The AR6000 is an integrated circuit intended to regulate the output voltage of an automotive alternator.

It supplies a current via a high-side MOSFET to the excitation coil of the alternator and provides an internal freewheeling diode. It allows the battery to keep its nominal charge and deliver current to electrical devices within the vehicle.

The IC provides a load response control mechanism (LRC and return LRC), and has an interface for the industry standard LIN protocol (v1.3 or 2.1, selectable by fuse) to allow an ECU (master) to control the regulated voltage and the LRC rate, among other parameters.

The ECU can also read back information about the status of the regulator and the alternator via LIN.

The programmable parameters through LIN by the ECU:

- Regulation voltage set point
- LRC ramp time
- LRC disable speed
- Excitation current limitation
- Blind zone value and inhibition
- Thermal compensation threshold adjustment

The parameters sent back through LIN to the ECU:

- Excitation duty cycle
- Measured excitation current
- Measured battery voltage
- Measured die temperature
- Measured alternator speed
- Manufacturer and class
- Faults:
 - Electrical, mechanical, temperature
 - LIN timeout
 - LIN communication error on checksum, ID parity, sync break, stop bit or bit sent.

The IC can be programmed as a one time programmable (OTP) device to fit a large number of alternators and applications. These programmable parameters are described in the functional device operation [Table 58](#).

9.2 Functional pin description

9.2.1 Phase (PH)

This pin is connected to one of the stator windings. This signal is used for the rotor speed measurement, stator voltage monitoring as well as the self start detection. The phase oscillation is monitored and phase boost is activated if phase amplitude is not crossing VTH_L and VTH_H successively.

9.2.2 LIN-bus (BUS)

This LIN pin represents the single-wire bus transmitter and receiver. It is suited for automotive bus systems and is based on LIN protocol defined in LIN-bus specification v2.1 and v1.3.

9.2.3 Ground pin (GND)

The AR6000 has one GND pin.

9.2.4 Supply voltage (B+A)

The AR6000 is supplied by this B+A pin. This voltage is also used as the feedback voltage by the regulation loop.

9.2.5 Excitation (EXC)

This pin is connected to the excitation coil (rotor) of the alternator. The IC supplies a current via a high-side driver to the rotor in order to control the output current of the alternator when load varies so as to maintain battery voltage at defined set point.

10 Functional internal block description

10.1 Supply voltage: filter/divider, band gap, POR

An input filter and divider provides an image of the battery voltage to the internal ADC, which sends the converted value to the digital regulation loop circuit.

The supply block provides the voltages for the internal blocks of the AR6000.

- Main logic
- All analog blocks (in wake-up and in standby modes)
- LIN transceiver
- Charge pump

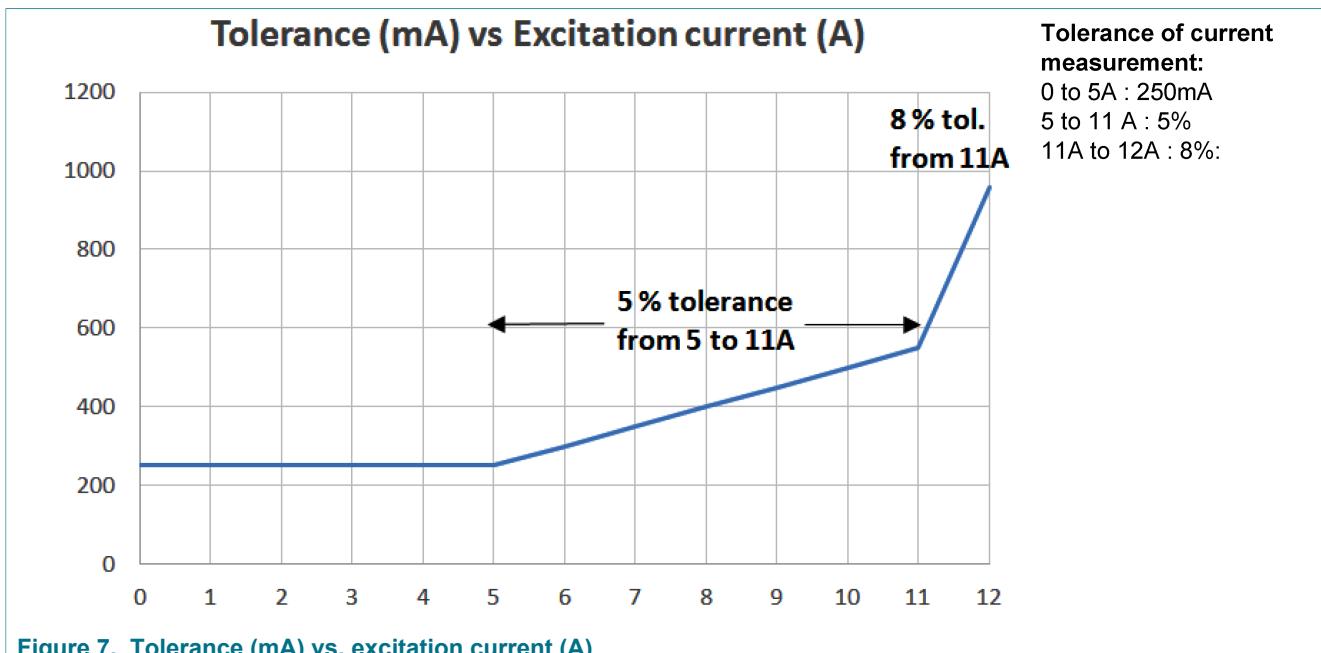

The purpose of the POR block is to generate a clean reset to the main logic. When a power-on reset occurs, device internal registers are reset and the device goes into standby mode.

The band gap block provides the voltage and current references for the other blocks.

10.2 Power stage: charge pump, drive and protection, current measurement

The power stage of the circuit consists of the gate driver with a charge pump and protection to control the internal N-channel power MOSFET switching a high-side driver. A short-circuit is instantaneously detected and the excitation current is turned off until the next regulation cycle. A freewheeling diode is inserted between the EXC and GND pins, across the excitation coil for the energy recirculation.

The current measurement block provides a value of the excitation current flowing in the high-side switch. The tolerance of the current value is defined according to [Figure 7](#).

10.3 Logic and control

10.3.1 Digital

The digital block gathers all the digital functions of the device. The main functionality is described in [Section 11 "Functional device operation"](#).

10.3.2 Clock

This block is the clock reference for all digital blocks. When the regulator has woken, two frequencies are provided: 8 MHz and a derived 4 MHz.

10.3.3 OTP

This block allows easy configuration and adjustment of the circuit. A large number of fuse bits can be programmed either by NXP or by customer at end of line. They are listed in [Table 58](#).

10.3.4 Phase LOW and HIGH

The phase detector monitors the phase input and sends filtered LOW and HIGH levels to the main logic when the phase signal is OK for regulation or for self-start.

10.3.5 ADC

The analog-to-digital converter is used in the voltage regulation loop for voltage and temperature measurements.

10.3.6 Current measurement

This block provides a measured value of the excitation current flowing in the power LDMOS to the logic.

10.3.7 LIN

This block controls the LIN-bus transmission and reception.

11 Functional device operation

11.1 LIN frames

The configuration of the LIN frames can be selected by fuse to fit the largest number of applications. 11 LIN configurations are available. They are listed in the following tables and their description begins in [Section 11.2 "Message frame for configuration version-A"](#).

Table 9. LIN frame configurations

LIN version	Frame type	Identifier (hex)
All	Rx	3C ^[1]

11.3 Message frame for configuration version-B

11.3.1 RxFrame

Table 16. Identifier: 0X29 (LIN1) or 0X2A (LIN2, LIN4) or 0X20 (LIN3)

Byte 1								Byte 2								Byte 3								Byte 4							
0	1	2	3	4	5	6	7	0	1	2	3	4	5	6	7	0	1	2	3	4	5	6	7	0	1	2	3	4	5	6	7
A				B				C				X	D				E				F	G				H					

- A: Voltage set value, 8 bits, [Table 40](#)
- B: Load response ramp time, 4 bits, [Table 41](#)
- C: Load response cut off speed, 4 bits, [Table 30](#)

D: Excitation current limitation, 7 bits, [Table 42](#)

E: Selection of output variable in TxFrame 3 byte 4, 3 bits

Output choice	Code
00000000	000
VB+	001
Umes	010
Tchip	011
Alt Speed	100
00000000	101
00000000	110
00000000	111

F: "Blind zone", 1 bit, [Table 32](#)

G: Voltage limitation for high temperature, 3 bits, [Table 33](#)

H: "Blind zone inhibition", 1 bit (enabled by programming), [Table 34](#)

11.3.2 TxFrame 1

Table 17. Identifier: 0X12 (LIN1) or 0X14 (LIN2, LIN4) or 0X21 (LIN3) OX11 (LIN4)

Byte 1								Byte 2								
0	1	2	3	4	5	6	7	0	1	2	3	4	5	6	7	
A			B					C				D				

A: Alternator supplier identification, 3 bits, [Table 37](#)

B: Alternator identification, 5 bits (defined by customer)

C: Chip supplier identification, 3 bits (defined by NXP: 010)

D: Chip identification, 5 bits (defined by NXP)

11.3.3 TxFrame 2

Table 18. Identifier: 0X15 (LIN1) or 0X16 (LIN2, LIN4) or 0X18 (LIN3)

Byte 1								Byte 2								Byte 3								Byte 4							
0	1	2	3	4	5	6	7	0	1	2	3	4	5	6	7	0	1	2	3	4	5	6	7	0	1	2	3	4	5	6	7
A	B	C	D					E					F	G	H	X	I	J	K												

A: Diagnosis flag for high temperature, 1 bit

B: Diagnosis flag for mechanical failure, 1 bit

C: Diagnosis flag for electrical failure, 1 bit

D: Duty cycle value of the excitation PWM, 5 bits, [Table 43](#)

E: Measured excitation current, 8 bits, [Table 38](#)

F: Confirmation of the selected output variable done in RxFrame byte 4, 3 bits

Selected code	Confirmation code	Output choice
000	000	00000000
001	001	VB+
010	010	Umes
011	011	Tchip
100	100	Alt Speed
101	101	00000000
110	110	00000000
111	111	00000000

G: I_{EXC} flag, 1 bit (enabled by programming)

H: LRC flag, 1 bit (enabled by programming)

I: Diagnosis flag for LIN error, 1 bit

J: Diagnosis flag LIN communication timeout, 1 bit

K: Set voltage, measured voltage, chip temperature or alternator speed, 8 bits, [Table 44](#)

11.4 Message frame for configuration version-C

11.4.1 RxFrame

Table 19. Identifier: 0X20

Byte 1								Byte 2								Byte 3								Byte 4								
0	1	2	3	4	5	6	7	0	1	2	3	4	5	6	7	0	1	2	3	4	5	6	7	0	1	2	3	4	5	6	7	
A	X								B				C				D								E							

A: LRC blind zone, 2 bits, [Table 45](#)

B: Load response ramp time, 4 bits, [Table 46](#)

C: Load response cut-off speed, 4 bits, [Table 30](#)

D: Regulation voltage set point, 8 bits, [Table 40](#)

E: Excitation current limitation, 8 bits, [Table 48](#)

11.4.2 TxFrame 1

Table 20. Identifier: 0X21

Byte 1								Byte 2								Byte 3								Byte 4							
0	1	2	3	4	5	6	7	0	1	2	3	4	5	6	7	0	1	2	3	4	5	6	7	0	1	2	3	4	5	6	7
A	B	C	D	E	X	X	X	F								G								H							

- A: Diagnosis flag for mechanical failure, 1 bit
- B: Diagnosis flag for electrical failure, 1 bit
- C: Diagnosis flag for communication error, 1 bit
- D: Diagnosis flag for timeout, 1 bit
- E: Diagnosis flag for high temperature, 1 bits
- F: Measured voltage on pad B+A, 8 bits, [Table 51](#)
- G: Measured excitation current, 8 bits, [Table 50](#)
- H: Duty cycle value of the excitation PWM, 8 bits, [Table 49](#)

11.4.3 TxFrame 2

Table 21. Identifier: 0X18

Byte 1								Byte 2															
0	1	2	3	4	5	6	7	0	1	2	3	4	5	6	7								
A								B								C							

- A: Temperature information, 8 bits, [Table 52](#)
- B: Alternator supplier identification, 3 bits, [Table 37](#)
- C: Alternator class identification, 5 bits (defined by customer)

11.5 Message frame for configuration version-D

11.5.1 RxFrame

Table 22. Identifier: 0X29 (LIN1) or 0X2A(LIN2)

Byte 1								Byte 2								Byte 3								Byte 4							
0	1	2	3	4	5	6	7	0	1	2	3	4	5	6	7	0	1	2	3	4	5	6	7	0	1	2	3	4	5	6	7
A				X X				B				C				D				X X X X X X X X											

- A: Voltage set value, 6 bits, [Table 28](#)
- B: Load response ramp time, 4 bits, [Table 29](#)
- C: Load response cut-off speed, 4 bits, [Table 30](#)
- D: Excitation current limitation, 5 bits, [Table 31](#)

11.5.2 TxFrame 1

Table 23. Identifier: 0X11 (LIN1) or 0X13 (LIN2)

Byte 1								Byte 2							
0	1	2	3	4	5	6	7	0	1	2	3	4	5	6	7
A	B	C	D					E					F	G	

- A: Diagnosis flag for high temperature, 1 bit
- B: Diagnosis flag for mechanical failure, 1 bit
- C: Diagnosis flag for electrical failure, 1 bit
- D: Duty cycle value of the excitation PWM, 5 bits, [Table 35](#)
- E: Measured excitation current, 6 bits, [Table 36](#) and temperature measurement, 6 bits, [Table 53](#)
- F: Diagnosis flag for LIN error, 1 bit
- G: Diagnosis flag LIN communication timeout, 1 bit

11.5.3 TxFrame 2

Table 24. Identifier: 0X12 (LIN1) or 0X14 (LIN2)

Byte 1								Byte 2							
0	1	2	3	4	5	6	7	0	1	2	3	4	5	6	7
A			B					C	D	E	F	X	X	X	X

- A: Alternator supplier identification, 3 bits, [Table 37](#)
- B: Alternator identification, 5 bits (defined by customer)
- C: Sync break fault, 1 bit
- D: ID parity fault, 1 bit
- E: Checksum fault, 1 bit
- F: Not slave responding fault, 1 bit

11.6 Message frame for configuration version-E

11.6.1 RxFrame

Table 25. Identifier: 0X29

Byte 1								Byte 2								Byte 3								Byte 4							
0	1	2	3	4	5	6	7	0	1	2	3	4	5	6	7	0	1	2	3	4	5	6	7	0	1	2	3	4	5	6	7
A			X		X		B			C		D					X		X		E		X		X		X				

- A: Voltage set value, 6 bits, [Table 28](#)
- B: Load response ramp time, 4 bits, [Table 47](#)
- C: Load response cut-off speed, 4 bits, [Table 30](#)
- D: Excitation current limitation, 8 bits, [Table 56](#)

E: "Blind zone", 1 bit, [Table 55](#)

11.6.2 TxFrame 1

Table 26. Identifier: 0X21

Byte 1								Byte 2								Byte 3								Byte 4							
0	1	2	3	4	5	6	7	0	1	2	3	4	5	6	7	0	1	2	3	4	5	6	7	0	1	2	3	4	5	6	7
A	B	C	D				E				X	X	X	X	X	X	G	H	I												

A: Diagnosis flag for high temperature, 1 bit

B: Diagnosis flag for mechanical failure, 1 bit

C: Diagnosis flag for electrical failure, 1 bit

D: Duty cycle value of the excitation PWM, 5 bits, [Table 35](#)

E: Measured excitation current, 8 bits, [Table 57](#)

G: Diagnosis flag for LIN error, 1 bit

H: Diagnosis flag LIN communication timeout, 1 bit

I: Chip temperature, 8 bits, [Table 52](#)

11.6.3 TxFrame 2

Table 27. Identifier: 0X12 (LIN1)

Byte 1								Byte 2							
0	1	2	3	4	5	6	7	0	1	2	3	4	5	6	7
A				B				C				D			

A: Alternator supplier identification, 3 bits, [Table 37](#)

B: Alternator identification, 5 bits (defined by customer)

C: Chip supplier identification, 3 bits (defined by NXP: 010)

D: Chip identification, 5 bits (defined by NXP)

12 Lookup tables

Table 28. Voltage set point (6 bits) – versions A, D and E

Code	V (± 100 mV at 25 °C)	Code	V (± 100 mV at 25 °C)
000000	10.6/off	100000	13.8
000001	10.7	100001	13.9
000010	10.8	100010	14
000011	10.9	100011	14.1
000100	11	100100	14.2
000101	11.1	100101	14.3
000110	11.2	100110	14.4
000111	11.3	100111	14.5
001000	11.4	101000	14.6
001001	11.5	101001	14.7
001010	11.6	101010	14.8
001011	11.7	101011	14.9
001100	11.8	101100	15
001101	11.9	101101	15.1
001110	12	101110	15.2
001111	12.1	101111	15.3
010000	12.2	110000	15.4
010001	12.3	110001	15.5
010010	12.4	110010	15.6
010011	12.5	110011	15.7
010100	12.6	110100	15.8
010101	12.7	110101	15.9
010110	12.8	110110	16
010111	12.9	110111	16
011000	13	111000	16
011001	13.1	111001	16
011010	13.2	111010	16
011011	13.3	111011	16
011100	13.4	111100	16
011101	13.5	111101	16
011110	13.6	111110	16
011111	13.7	111111	16 ^[1]

[1] 14.5 V (at 25 °C) with a $T_c -4.0$ mV/°C for version E.

Table 29. LRC ramp time – versions A and D

Ramp time	Seconds ($\pm 10\%$)	Ramp time	Seconds ($\pm 10\%$)
0000	0	1000	8
0001	1	1001	9
0010	2	1010	10
0011	3	1011	11
0100	4	1100	12
0101	5	1101	13
0110	6	1110	14
0111	7	1111	15

Table 30. LRC disable speed (4 bits) – versions A, B, C, D and E

Speed	RPM ($\pm 10\%$)	Speed	RPM ($\pm 10\%$)
0000	2400	1000	4000
0001	2530	1001	4360
0010	2670	1010	4790
0011	2830	1011	5320
0100	3000	1100	5990
0101	3200	1101	6860
0110	3430	1110	8010
0111	3690	1111	always active

Table 31. Excitation current limitation (5 bits) – versions A and D

EXC code	EXC current (A)	EXC code	EXC current (A)
00000	no limitation/ only current protection activated	10000	4
00001	2	10001	4.25
00010	2	10010	4.5
00011	2	10011	4.75
00100	2	10100	5
00101	2	10101	5.25
00110	2	10110	5.5
00111	2	10111	5.75
01000	2	11000	6
01001	2.25	11001	6.25
01010	2.5	11010	6.5
01011	2.75	11011	6.75

EXC code	EXC current (A)	EXC code	EXC current (A)
01100	3	11100	7
01101	3.25	11101	7.25
01110	3.5	11110	7.5
01111	3.75	11111	7.75

Table 32. Blind zone (1 bit) – versions A and B

Blind zone ($\pm 1.5\%$)	Value
3 %	0
12 %	1

Table 33. Reference voltage limitation for high temperatures (3 bits) – versions A and B

Temperature	Code
Default value 0 °C	000
Default value -16 °C	001
Default value -12 °C	010
Default value -8.0 °C	011
Default value -4.0 °C	100
Default value +4.0 °C	101
Default value +8.0 °C	110
Default value +12 °C	111

Table 34. Blind zone inhibition (1 bit) – versions A and B

BZI	BZ
0	enabled
1	disabled

Table 35. Duty cycle value (5 bits) – versions A, D and E

EXC duty cycle	DF ($\pm 3\%$)	EXC duty cycle	DF ($\pm 3\%$)
00000	0 < DF < 3.125	10000	50 < DF < 53.125
00001	3.125 < DF < 6.25	10001	53.125 < DF < 56.25
00010	6.25 < DF < 9.375	10010	56.25 < DF < 59.375
00011	9.375 < DF < 12.5	10011	59.375 < DF < 62.5
00100	12.5 < DF < 15.625	10100	62.5 < DF < 65.625
00101	15.625 < DF < 18.75	10101	65.625 < DF < 68.75
00110	18.75 < DF < 21.875	10110	68.75 < DF < 71.875

EXC duty cycle	DF ($\pm 3\%$)	EXC duty cycle	DF ($\pm 3\%$)
00111	21.875 < DF < 25	10111	71.875 < DF < 75
01000	25 < DF < 28.125	11000	75 < DF < 78.125
01001	28.125 < DF < 31.25	11001	78.125 < DF < 81.25
01010	31.25 < DF < 34.375	11010	81.25 < DF < 84.375
01011	34.375 < DF < 37.5	11011	84.375 < DF < 87.5
01100	37.5 < DF < 40.625	11100	87.5 < DF < 90.625
01101	40.625 < DF < 43.75	11101	90.625 < DF < 93.75
01110	43.75 < DF < 46.875	11110	93.75 < DF < 96.875
01111	46.875 < DF < 50	11111	96.875 < DF < 100

Table 36. Excitation current measurement (6 bits) – versions A and D

EXC code	EXC current (A)	EXC code	EXC current (A)
000000	0	100000	4
000001	0.125	100001	4.125
000010	0.25	100010	4.25
000011	0.375	100011	4.375

13 Logic commands and registers

This IC is one time programmable (OTP), during final test at NXP or by the customer on end of line test. The OTP programmable options table ([Table 58](#)) describes the programmable functions that are selectable by customer. Programming (fusing) is performed in one time either by the supplier (at probe test) or by the customer (end of line).

Table 58. OTP programmable options

Function	OTP bits	Comments
LIN frame configuration	4	see Table 10
LIN protocol	2	LIN 1.3 or LIN 2.1 with assign frame ID service disabled or LIN 2.1 with assign frame ID service enabled
Specific bit for LIN Version A and B (LRC and I_{EXC} flags)	1	enabled or disabled
Default regulation voltage	3	13.5 V, 13.7 V, 14.0 V, 14.1 V, 14.3 V, 14.5 V, 14.7 V or 14.9 V (± 100 mV at 25 °C)
Excitation duty cycle filter mode in phase regulation	2	regulation duty cycle, pre-excitation duty cycle, 0 % duty cycle or real duty cycle
Maximum on time for phase regulation	2	27 ms, 45 ms, 100 ms, 155 ms (± 5.0 %)
Pre-excitation duty cycle	3	5 %, 7.5 %, 10 %, 12.5 %, 15 %, 17.5 %, 20 %, 25 % (± 1.0 %)
Pre-excitation behavior		two options are selectable (described in Section 14.4 "Pre-exc")
Filter frequency of reported battery voltage measurement	2	0 Hz, 1 Hz, 5 Hz or 10 Hz (± 5.0 %)
Filter frequency of reported duty cycle report (DF)	2	0 Hz, 1 Hz, 5 Hz or 10 Hz (± 5.0 %)
Filter frequency of reported excitation current measurement	2	0 Hz, 1 Hz, 5 Hz or 10 Hz (± 5.0 %)
Default LRC disable speed	2	3000 RPM, 4000 RPM, 4800 RPM and 6000 RPM (± 10 %)
Default LRC duration	3	1 s, 2 s, 3 s, 4 s, 5 s, 6 s, 7 s or 8 s (± 10 %)
LRC after priority charge	1	enabled or disabled (behavior described in Section 18 "Operation voltage - priority charge function")
Default LRC return duration	2	0.5 s, 1 s, 1.5 s or 2 s (± 10 %) (behavior described in Section 17 "Return LRC")
Alternator pole pairs	2	5, 6, 7 or 8

Function	OTP bits	Comments
Self-start speed threshold	2	2000 RPM, 3000 RPM, 4000 RPM or 5000 RPM ($\pm 10\%$)
Bus inactivity or data corruption timeout	1	3 s or 10 s
Excitation off for $V_{SET} = 10.6\text{ V}$	1	enabled or disabled
Excitation short-circuit threshold (at 25 °C)	2	9 A, 10 A, 11 A or 12 A ($\pm 1.0\text{ A}$)
Electrical flag in case of undervoltage	1	flag = 1 if priority charge function is activated for more than T_{DEFECT} or $V_{SET} > V_{BAT}$ flag = 0 if $V_{SET} > V_{BAT}$
Mechanical flag configuration	1	flag = 1 in PreExc mode or flag = 0 if PreExc mode and $10.6\text{ V} < V_{SET} < V_{B+A}$
Ovvervoltage fault flag	1	enabled or disabled
Low-voltage threshold	2	8.75 V, 9.25 V, 9.75 V or 10.25 V ($\pm 200\text{ mV}$)
Thermal compensation threshold	3	125 °C, 130 °C, 135 °C, 140 °C, 145 °C, 150 °C, 155 °C or 160 °C ($\pm 10\text{ °C}$)
Thermal compensation temperature gradient	3	-50 mV/°C, -100 mV/°C, -150 mV/°C, -200 mV/°C, -250 mV/°C, -300 mV/°C, -350 mV/°C, -400 mV/°C ($\pm 10\%$)
Fault deglitching time	2	50 ms, 250 ms, 400 ms or 1000 ms ($\pm 10\%$)
Phase deglitcher duration	2	0.15 ms, 0.75 ms, 1.5 ms or 2.5 ms
Blind zone value in default mode	2	0 %, 3.25 %, 6 % or 12 % ($\pm 1.0\%$)
Blind zone inhibition	1	enabled or disabled
Alternator supplier and class	3 and 5	alternator information

14 State machine

The following figure describes the state machine of the AR6000.

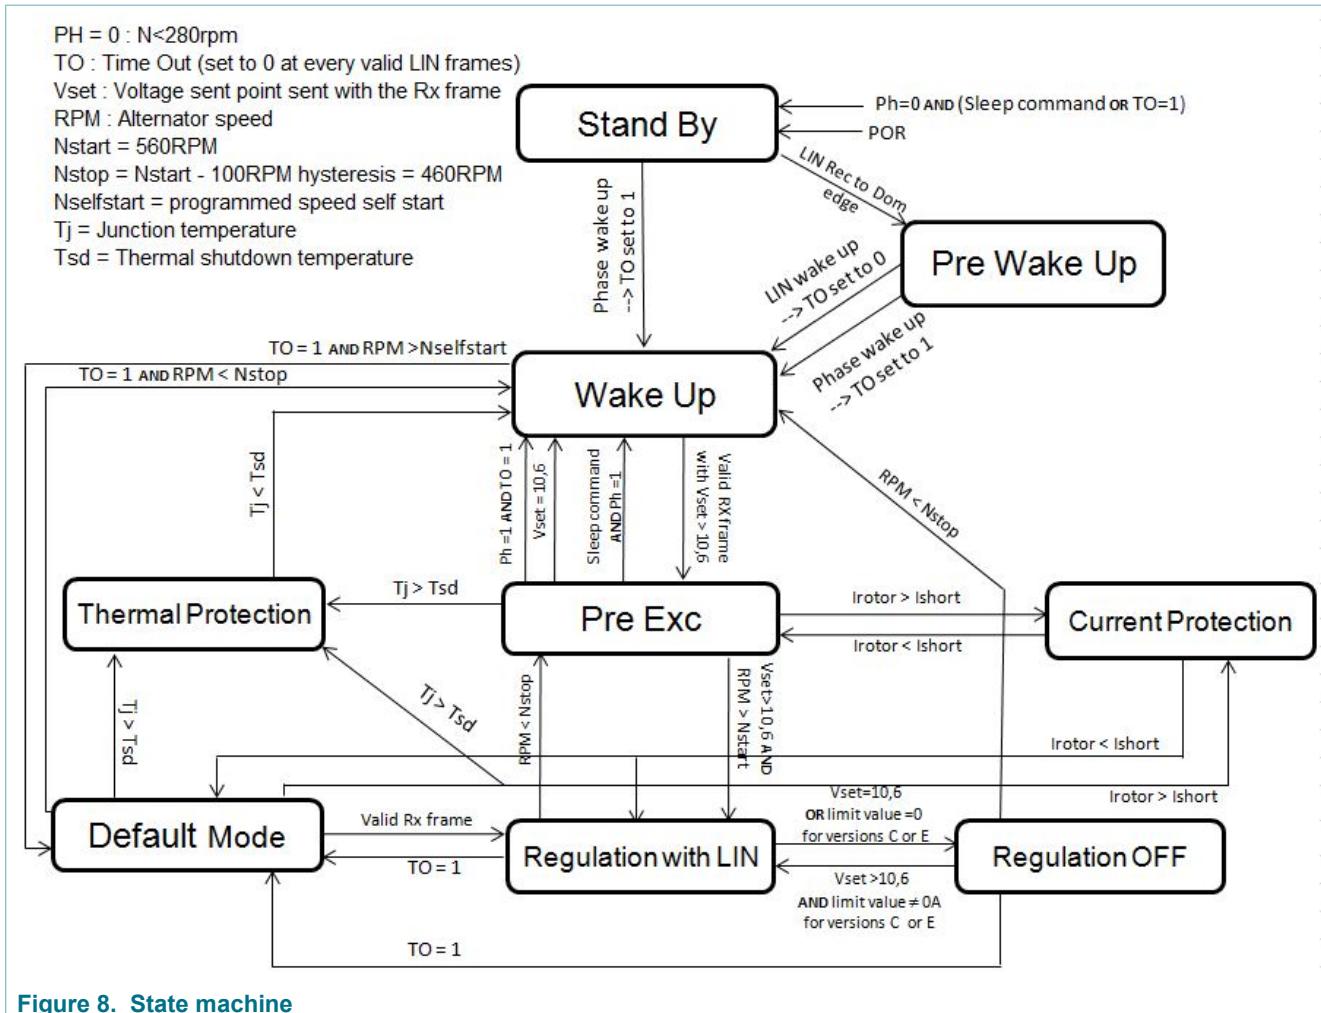

Figure 8. State machine

14.1 Standby

The AR6000 is in standby mode, if there is a LIN timeout and when alternator is not in rotation (no phase), or in case of power-on reset (POR), or with a sleep command without phase activity.

- There is no excitation
- The duty cycle (DC) is equal to zero

The device needs only a small amount of quiescent current to supply logic, phase detector, and LIN receiver.

LIN timeout means no valid LIN frame on the LIN-bus during 3.0 s or 10 s (according to configuration).

14.2 Wake-up

This state is reached when a LIN wake-up has been validated or when an edge on phase input is detected.

- The logic is on and internal clock is available
- All the blocks are on
- There is no regulation DC = 0 %
- Phase sensitivity is 200 mV typ. for a wake-up by phase and in default mode, otherwise 800 mV typ.

After a LIN timeout, if no valid instruction is decoded, the device goes back into standby mode.

14.3 Pre wake-up mode

When a transition from recessive to dominant is detected on LIN-bus, a timer should be started to check duration of this dominant state. If duration is less than T_{minwu} , design goes back to standby mode. Otherwise design is looking for dominant to recessive LIN transition to validate wake-up event. If dominant to recessive LIN transition takes place before timeout is elapsed (T_{wuto}), wake-up event is validated and design goes to wake-up mode; if wake-up event is not validated, design goes back to standby (unless a wake-up by phase input transition is in progress).

Table 59. Pre wake-up mode

Data	Description	Min.	Typ.	Max.	Unit
T_{minwu}	minimum dominant pulse timing for LIN wake-up	30	-	150	μs
T_{wuto}	LIN wake-up timeout	5	-	-	ms

14.4 Pre-exc

The pre-excitation state is reached as soon as a valid instruction for the regulated value (V_{REG}), different from 10.6 V, is decoded.

The purpose of pre-excitation is to increase the alternator magnetization, to guarantee a minimum phase voltage for rotor speed measurement.

The pre-excitation stays active until the detection of phase starts regulating RPM (N_{START}).

There are two types of pre-excitation (selectable by the OTP fuse):

Pre-exc 1:

- If $V_{SET} < V_{BAT}$ or if $V_{SET} > V_{BAT}$ in the conditions previously described to enter pre-excitation, the regulator has pre-excitation duty cycle until N_{START} is reached.

Pre-exc 2:

- If $V_{SET} < V_{BAT}$ in the conditions previously described to enter pre-excitation, the regulator has pre-excitation duty cycle until N_{START} is reached. Excitation limitation is active and current limitation is set to 1.0 A.

- If $V_{SET} > V_{BAT}$ in the conditions previously described to enter pre-excitation, the regulator duty cycle goes to 100 % until N_{START} is reached. Excitation limitation and LRC are active if requested by LIN in this pre-excitation type.

In order to avoid disturbance of speed measurement due to parasitics generated by excitation switching, a deglitcher is inserted between phase input and phase processing logic. The duration of this deglitcher is selected by two configuration bits of [Table 58](#) (four values are available: 0.15 ms, 0.75 ms, 1.5 ms and 2.5 ms).

14.5 Regulation with LIN

In this mode, the AR6000 regulates the alternator output to the set reference level. The excitation is controlled by LRC if this LRC mode is active, until speed reaches LRC disable speed.

14.6 Default mode

This mode is equivalent to the “Regulation with LIN” mode except that the default parameters (V_{REG} , LRC rate, LRC_{DISF} ,...) are used for regulation, as there is no LIN communication. These parameters are programmed at the end of line testing.

When there is no valid frame for more than LIN timeout, regulation voltage target transitions to default V_{REG} with a ramp of 0.2 V/s ($\pm 10\%$) and excitation limitation value transitions to “no limitation” (equivalent to a 12.7 A limitation value) with a ramp of 0.375 A/s ($\pm 10\%$).

If communication resumes with RX frames, regulation voltage target and current limitation changes with no delay to their respective values set by LIN.

15 Phase regulation

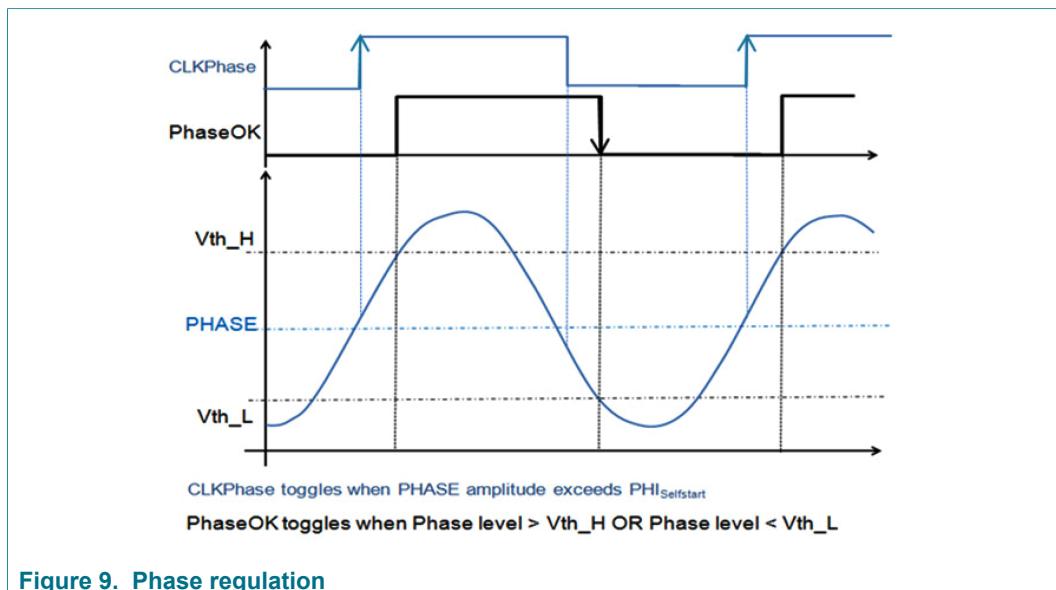

This function avoids losing phase signal amplitude for proper regulation when the voltage in the board harness is higher than the set point value (case of load shedding, or set point below battery voltage).

The regulator monitors the voltage levels of the phase signal and checks if the phase oscillates between V_{TH_L} and V_{TH_H} , ensuring phase amplitude is sufficient for regulation. Phase failure is detected if there is no PhaseOK rising edge for more than 30 ms. In this case the phase regulation is started.

The phase regulation function is performed by applying 100 % duty cycle current to the rotor, so the phase amplitude can build up. This 100 % duty cycle is stopped, either when the rising edge of PhaseOK is present again, or when the maximum duration of phase regulation is reached (this timing is determined by programming the $t_{ONBOOST}$ parameter, max on time for phase boost).

If the PhaseOK signal recovers, then fails again before the end of $t_{ONBOOST}$ timer, another $t_{ONBOOST}$ time is initiated.

If the phase is still not OK after $t_{ONBOOST}$, the device goes back to regulation mode and starts a 300 ms ‘failure’ timer. When this 300 ms timer has elapsed, if there is still no PhaseOK rising edge for the next 30 ms, the phase boost function is active again for a maximum duration of $t_{ONBOOST}$. The number of retries is not limited.

**Figure 9. Phase regulation**

There are two different values for CLKPhase signal detection, according to regulator mode:

Table 60. CLKPhase detection threshold voltage

Mode	Description	Min.	Typ.	Max.	Unit
Φ_{START1}	minimum peak-to-peak phase voltage in standby/ wake-up/ default mode	150	200	250	mV
Φ_{START2}	minimum peak-to-peak phase voltage in pre-excitation/ regulation mode	700	800	900	mV

Threshold values for PhaseOK signal are as follows:

Table 61. PhaseOK detection threshold voltage

Data	Description	Min.	Typ.	Max.	Unit
$V_{\text{th_H}}$	positive peak threshold	3	4	5	V
$V_{\text{th_L}}$	negative peak threshold	0.75	1.78	2.25	V

$t_{\text{ON BOOST}}$ time is selectable by fuse and four values are available: 27 ms, 45 ms, 100 ms, or 155 ms.

16 Blind zone

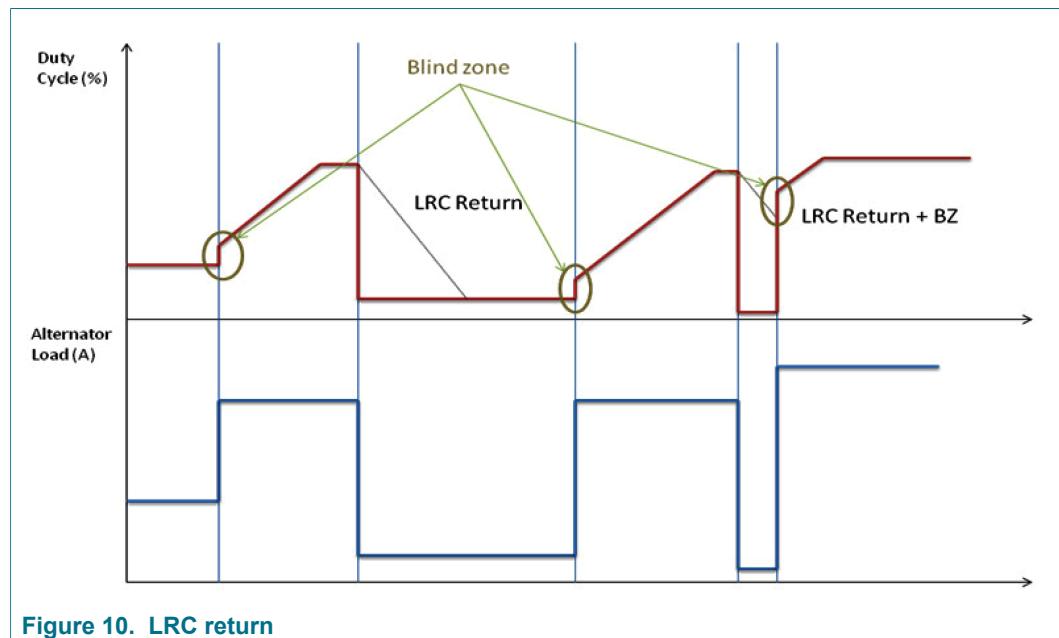

If blind zone function is not inhibited by a LIN command, the duty cycle defined by the fuse configuration is used. For example, if a 3 % blind zone is selected, no LRC ramp is applied for a duty cycle variation less than 3 %.

17 Return LRC

The purpose of return LRC is to control excitation duty cycle in cases of load deactivation.

- This function is always active whatever the alternator speed.
- This function is active in default mode and in regulation mode.
- The LRC return value can be changed by OTP.

Example of operation: duty cycle ramp down is controlled by the return LRC timer when the duty cycle change exceeds blind zone value. In this diagram, LRC is also visible in the ramp up when load is switched on.

18 Operation voltage - priority charge function

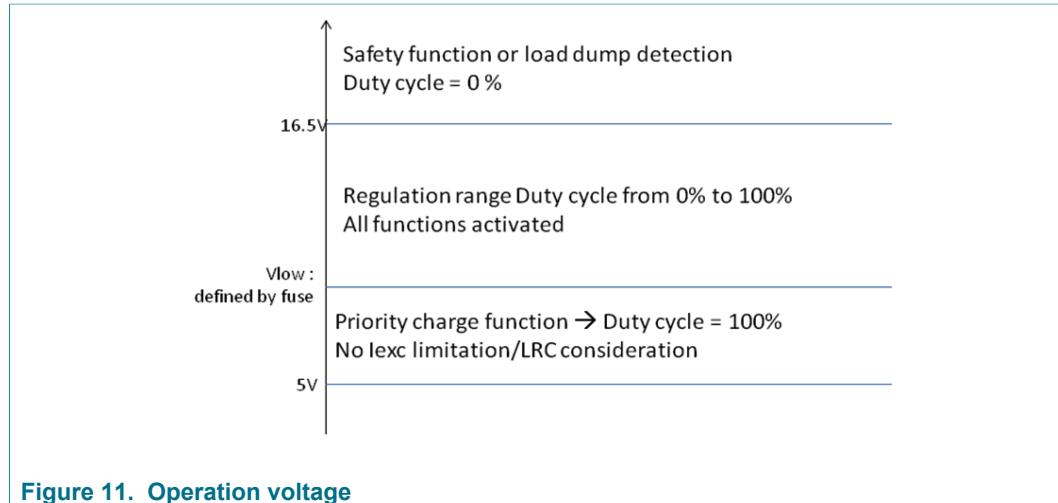

Figure 11. Operation voltage

Nominal operation voltage is from 5.0 V to 16.5 V. When battery voltage drops below V_{LOW} (value selectable by fuse), the priority function is enabled (with two possible behaviors to select by fuse):

- First behavior: When the voltage reaches the V_{LOW} threshold, LRC is disabled and 100 % duty cycle is applied until V_{SET} is reached.

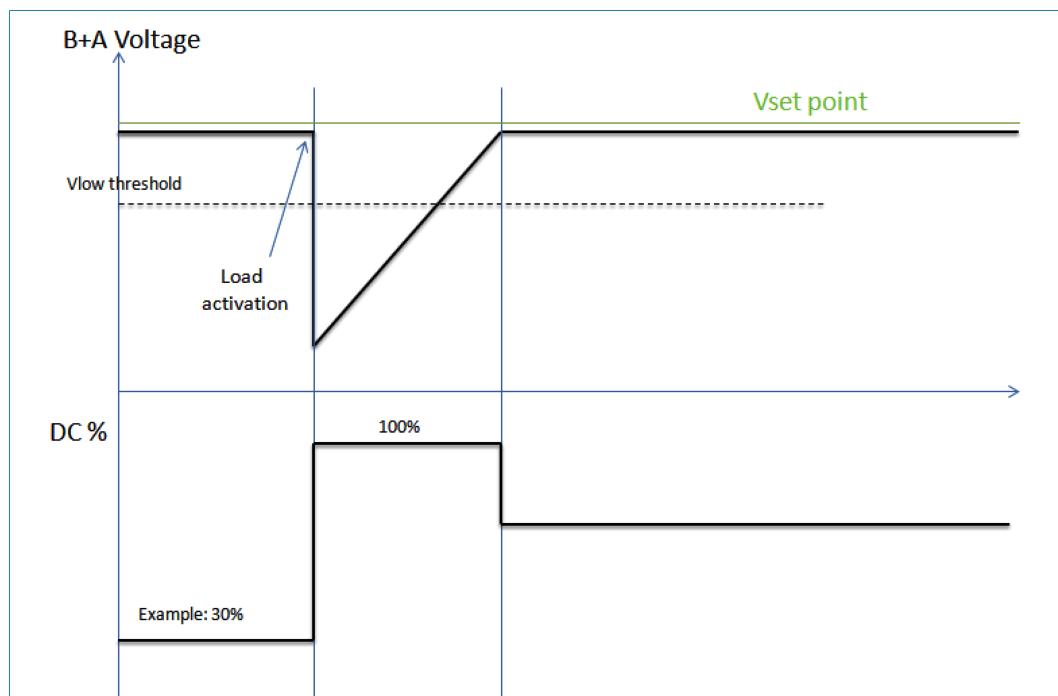

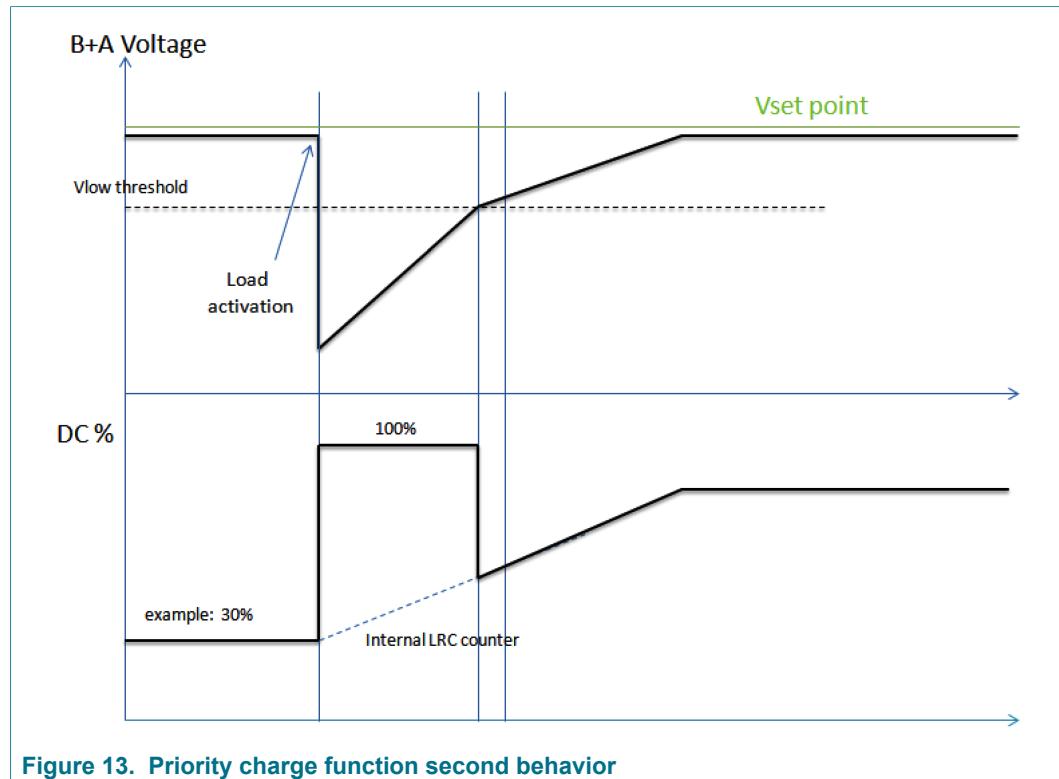

Figure 12. Priority charge function first behavior

- Second behavior: When the voltage reaches the V_{LOW} threshold, the LRC is disabled and 100 % duty cycle is applied until V_{LOW} threshold is reached (upward). When V_{LOW} is reached, LRC is enabled until V_{SET} is reached.

When this function is activated, the current limitation is disabled.

If battery voltage drops to 3.0 V, most of the analog blocks are disabled, including the internal clock, but all register contents of the main logic are kept, so that regulation can resume with stored values as soon as possible, when battery voltage is back in the normal operating range. Below 3.0 V, a reset is allowed and therefore all register contents are lost.

19 Power supply rejection

In case of short battery drops (voltage down to zero volt at the lowest), regulation is disturbed only during the low battery pulse and is back to normal regulation after the pulse (all register contents in digital loop are kept). The device is able to withstand such “microcuts” during 40 μ s maximum, using an internal tank capacitor.

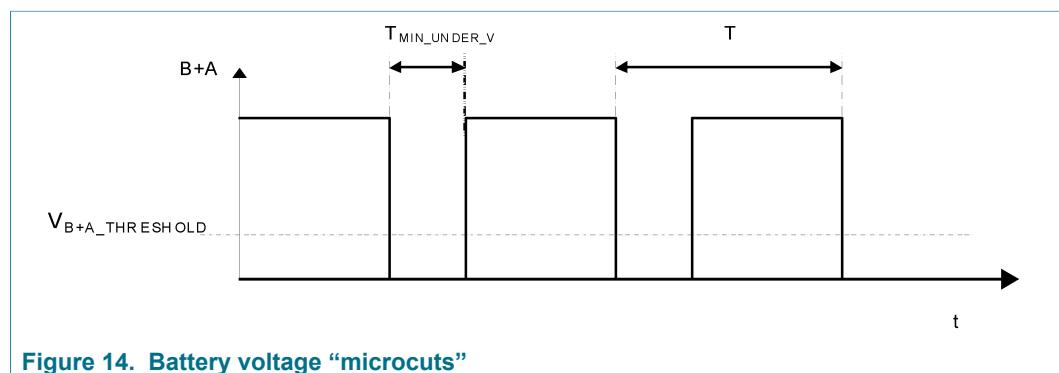

Table 62. Battery voltage microcuts

Data	Description	Min.	Typ.	Max.	Unit
T	minimum time between two undervoltage events	250	—	1000	μs
t _{MIN_UNDER_V}	minimal undervoltage time the regulator must withstand whatever the T°C	40	—	—	μs
V _{B+A_THRESHOLD}	B+A undervoltage threshold	0	—	5.0	V

If timing between two such undervoltage events is shorter than 250 μs, logic registers may reset, resulting in loss of register content.

Below 5.0 V, most analog blocks are disabled (main logic clock, regulation loop, excitation driver, LIN transceiver). Main logic is supplied as long as battery voltage is higher than 3.0 V.

20 Behavior without battery

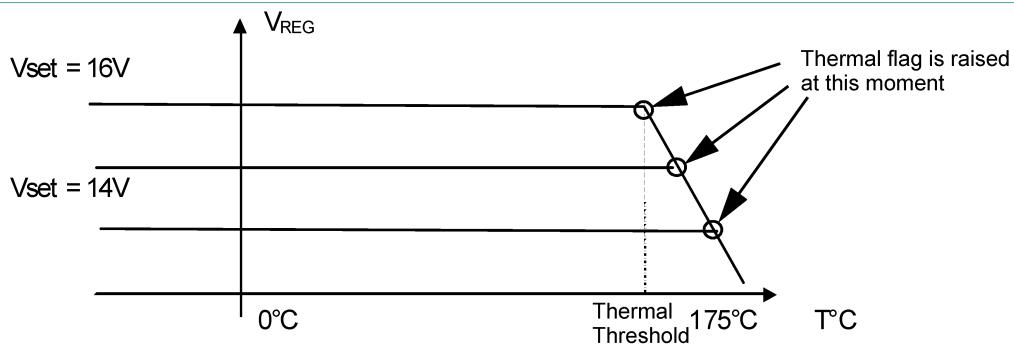

In case of a battery disconnection from the alternator output, the regulator maintains the alternator voltage within the range of $V_{REAL} \pm 0.5$ V.

Table 63. Behavior without battery

Data	Description	Min.	Typ.	Max.	Unit
DC_VWITHOUT_BATT	additional tolerance in case of operation without battery	$V_{REAL} - 0.5$	V_{REAL}	$V_{REAL} + 0.5$	V

21 Thermal compensation

This function is activated when the internal temperature is above the thermal threshold (selectable by a fuse, from 125 °C to 160 °C). In this case, the voltage set point is fixed by LIN or by default is decreased to reduce internal temperature. The derating is also selectable by a fuse (from -50 mV/°C to -400 mV/°C).

**Figure 15. Thermal compensation**

22 Protection and diagnosis features

22.1 Fault detection

General Notes

All fault reporting passes through a digital filter to avoid false indication problems, this deglitching time is selectable by fuse from 50 ms to 1000 ms.

22.2 Mechanical fault (F_MEC)

When the alternator speed is $0 \text{ RPM} < N_{ALT} < N_{START}$ the flag must be set to logic 1.

When $N_{ALT} > N_{START}$, regulation starts and F_MEC flag is set to logic 0 as long as $N_{ALT} > N_{STOP}$ (if $N_{ALT} < N_{STOP}$ then F_MEC is set to logic 1).

$N_{STOP} = (N_{START} - N_{S_HYST})$. N_{START} and N_{S_HYST} are defined in [Table 8](#).

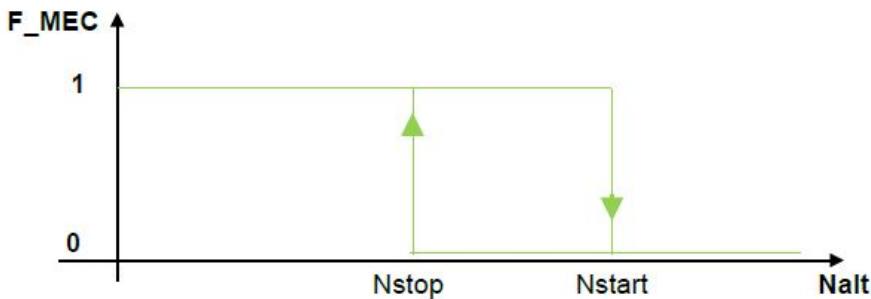

Figure 16. Mechanical fault threshold

22.3 Electrical fault (F_EL)

If one of these faults appear:

- **Excitation short to battery or to ground:**

Duty cycle of power output driver and excitation voltage are monitored.

- If $V_{EXC} < 1.5 \text{ V}$ and duty cycle of excitation driver is 100 % for more than t_{DEFECT} , a short of excitation to ground is detected and F_EL is set to 1.
- If $V_{EXC} > 1.5 \text{ V}$ and duty cycle of excitation driver is OFF for more than t_{DEFECT} , a short of excitation to battery is detected and F_EL is set to 1.

- **Alternator rotor open**

- If excitation current measured is below 1.0 A when excitation duty cycle is 100 % for more than t_{DEFECT} , an open rotor is detected and F_EL is set to 1.

- **Observed phase short**

- If phase regulation has failed after $t_{ONBOOST}$ for more than t_{DEFECT} , the F_EL is set to 1.

- **B+A voltage too low**

- If the priority charge function is active during t_{DEFECT} and the target voltage is not reached, F_EL is set to 1 if the “Electrical flag in case of low-voltage” OTP fuse has been set to 1.

- **Oversupply (safety function activation)**

- If the OTP fuse “Oversupply Fault Flag” = 1, F_EL is set to 1, in case of an oversupply on B+A as shown in [Section 23 "Safety function"](#).

- **Double error in configuration OTP fuse**

- If a double error (error which cannot be corrected with redundant ECC code) in customer configuration OTP fuse bits occurs, F_EL sets to 1 after t_{DEFECT} .

22.4 Thermal fault (F_HT)

A thermal fault is reported when thermal compensation starts to operate (see [Section 21 "Thermal compensation"](#)).

22.5 Timeout flag (TO)

Timeout between two consecutive valid messages is 3 s or 10 s. If this time is exceeded, the TO flag is raised and reset after reading.

22.6 Communication error flag

- LIN 2.1 or LIN 1.3: “checksum” error detected: A checksum error is detected
- LIN 2.1 or LIN 1.3: “identifier parity error” detected: The parity field (P0 and P1) of a known identifier is wrong
- LIN 2.1 or LIN 1.3: “Inconsistent-Synch-Field-Error”: Edges of the SYNCH field are detected outside the given tolerances
- LIN 2.1 or LIN 1.3: “stop bit” detected: LIN-bus line is dominant while stop bit
- LIN 2.1 or LIN 1.3: “bit error” detected: The received bit is different from the bit sent

The communication error flag is reset after reading.

22.7 LRC flag

The LRC flag is set to 1 when LRC is active for more than 15 ms. If LRC is no longer active for more than 15 ms, the LRC Flag is reset. This flag has to be enabled by OTP.

22.8 Excitation current limitation flag

Excitation current limitation flag (IExc flag) is set to 1 when excitation current is limited and has reached the current limitation value set by LIN for more than 15 ms. When excitation current is no longer limited for more than 15 ms, the IExc flag is reset.

Excitation current limitation flag is disabled in Pre-excitation mode 2 when $V_{SET} < V_{BAT}$.

This flag has to be enabled by OTP.

The following table summarizes F_MEC, F_EL, and F_HT operation based on regulator state.

Table 64. F_MEC, F_EL, and F_HT operation details

Fault Reporting		Wake-up mode Nalt < Nstop $V_{set} = 10.6 \text{ V}$	Pre-excitation mode		Regulation mode					
			N < Nstart		N > Nstart					
			$10.6 < V_{set} < U_{bat}$	$V_{set} > V_{bat}$	Exc OFF state enabled			Exc OFF state disabled		
Vset = 10.6 V	$V_{set} < U_{bat}$	$V_{set} > V_{bat}$	$V_{set} = 10.6 \text{ V}$	$V_{set} < U_{bat}$	$V_{set} > V_{bat}$	$V_{set} < U_{bat}$	$V_{set} > V_{bat}$	$V_{set} < U_{bat}$	$V_{set} > V_{bat}$	
Alt speed < Nstart	F_MEC	0	1 ^[1]	1	0	0	0	0	0	
Oversupply (safety function)	F_EL	1 ^[1]	1 ^[1]	0	1 ^[1]	1 ^[1]	0	1 ^[1]	0

Double error to OTP fuses	F_EL	1	1	1	1	1	1	1	1	
Too high temperature	F_HT	0	0	0	0	1	1	1	1	

[1] Can be disabled by OTP

23 Safety function

To avoid battery overcharge, a safety function is implemented with two redundant methods to measure the battery voltage. The voltage dividers and voltage references shown in [Figure 17](#) are independent. When either of the detectors (ADC or comparator) has reported to safety logic of an overvoltage condition (battery voltage above Alarm_TH), the power LDMOS providing excitation current is turned off and the electrical flag is set to logic 1. A separate pull-down circuitry on the power LDMOS gate ensures that excitation is turned off, even in case of ADC, safety logic, or gate driver failure.

To change to normal regulation mode, both conditions have to be met:

- CompOut = 0
- ADC value < 16.5 V

Once activated, the safety function maintains excitation off until V_{BAT} stays below the safety threshold (typ. 16.5 V) for a minimum of 500 ms.

When the alarm threshold is reached, the electrical flag sets to 1 if the fuse “Overvoltage Error Flag Enable” has been selected.

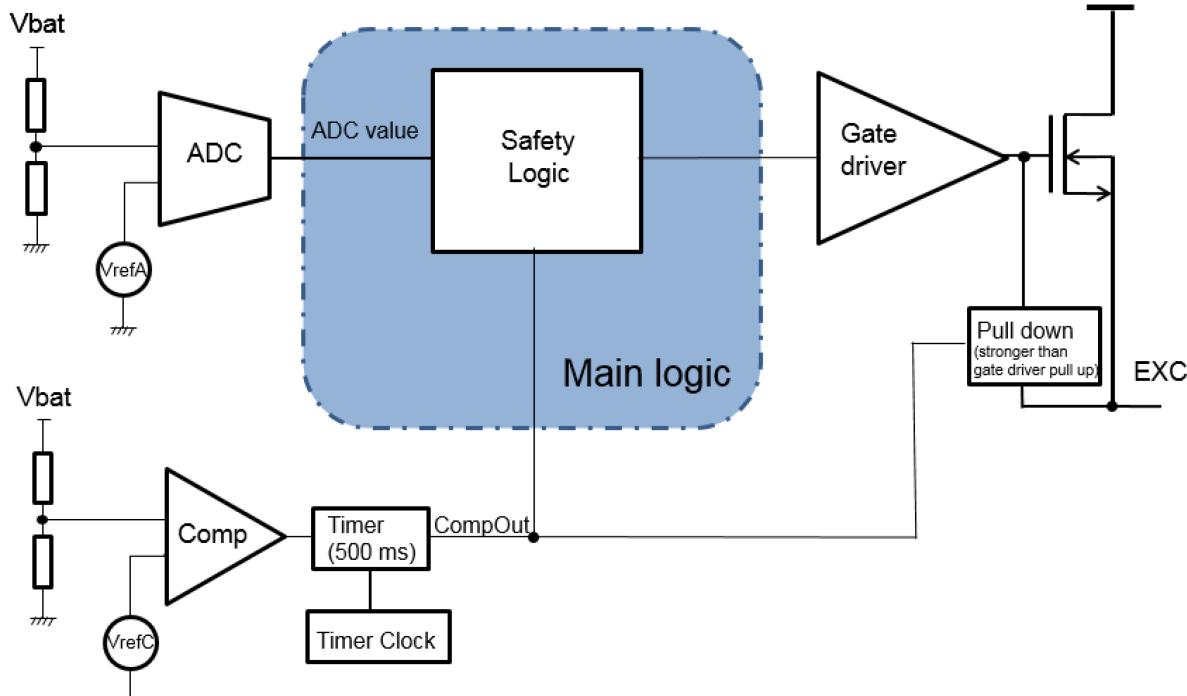

Figure 17. Safety function

Table 65. Safety function threshold and filtering

Symbol	Parameter	Min.	Typ.	Max.	Unit
Alarm_TH	alarm system threshold	16.2	16.5	16.8	V
Filtering	timer	450	500	550	ms

24 Test mode and programming

24.1 Test mode entry

The entrance in this specific mode is performed through two different steps:

- Key and seed exchange
- Test mode request/activation

24.2 Test mode function

Different functions could be activated according to function ID (**FID**):

- Clocks acceleration
- Clocks deactivation
- Test mode deactivation
- Die information reading
- OTP memory reading (specified in the programming specification)
- OTP memory programming (specified in the programming specification)

24.2.1 i/ Clocks acceleration

This function is used to accelerate all timers during test sequence like:

- Timer fault
- LIN timeout
- Phases timeout
- LRC

The timer test mode increases the timer clock by 32. It means all the previous functions are 32 times shorter. For example, if an LRC ramp time of 10 s is required by LIN, in this specific mode, the LRC duration is $10\text{ s}/32 = 312\text{ ms}$.

24.2.2 ii/ Clocks deactivation

This function deactivates all timers listed previously. This function is used during the alternator end of line test. The aim is to allow the alternator to supply the maximum load in the shortest possible delay. Therefore in this specific mode, the LRC has to be disabled, as well as the default timer.

24.2.3 iii/ Test mode deactivation

This function is used to exit test mode.

24.2.4 iv/ Die information reading

This function is used to read information like:

- Wafer number
- Wafer lot number
- Die version
- X die position on wafer
- Y die position on wafer

24.2.5 v/ OTP memory bytes reading

This function is used to read some configuration information.

26.1 Data sheet status

Document status ^{[1][2]}	Product status ^[3]	Definition
Objective [short] data sheet	Development	This document contains data from the objective specification for product development.
Preliminary [short] data sheet	Qualification	This document contains data from the preliminary specification.
Product [short] data sheet	Production	This document contains the product specification.

[1] Please consult the most recently issued document before initiating or completing a design.

[2] The term 'short data sheet' is explained in section "Definitions".

[3] The product status of device(s) described in this document may have changed since this document was published and may differ in case of multiple devices. The latest product status information is available on the Internet at URL <http://www.nxp.com>.

26.2 Definitions

Draft — The document is a draft version only. The content is still under internal review and subject to formal approval, which may result in modifications or additions. NXP Semiconductors does not give any representations or warranties as to the accuracy or completeness of information included herein and shall have no liability for the consequences of use of such information.

Short data sheet — A short data sheet is an extract from a full data sheet with the same product type number(s) and title. A short data sheet is intended for quick reference only and should not be relied upon to contain detailed and full information. For detailed and full information see the relevant full data sheet, which is available on request via the local NXP Semiconductors sales office. In case of any inconsistency or conflict with the short data sheet, the full data sheet shall prevail.

Product specification — The information and data provided in a Product data sheet shall define the specification of the product as agreed between NXP Semiconductors and its customer, unless NXP Semiconductors and customer have explicitly agreed otherwise in writing. In no event however, shall an agreement be valid in which the NXP Semiconductors product is deemed to offer functions and qualities beyond those described in the Product data sheet.

26.3 Disclaimers

Limited warranty and liability — Information in this document is believed to be accurate and reliable. However, NXP Semiconductors does not give any representations or warranties, expressed or implied, as to the accuracy or completeness of such information and shall have no liability for the consequences of use of such information. NXP Semiconductors takes no responsibility for the content in this document if provided by an information source outside of NXP Semiconductors. In no event shall NXP Semiconductors be liable for any indirect, incidental, punitive, special or consequential damages (including - without limitation - lost profits, lost savings, business interruption, costs related to the removal or replacement of any products or rework charges) whether or not such damages are based on tort (including negligence), warranty, breach of contract or any other legal theory. Notwithstanding any damages that customer might incur for any reason whatsoever, NXP Semiconductors' aggregate and cumulative liability towards customer for the products described herein shall be limited in accordance with the Terms and conditions of commercial sale of NXP Semiconductors.

Right to make changes — NXP Semiconductors reserves the right to make changes to information published in this document, including without limitation specifications and product descriptions, at any time and without

notice. This document supersedes and replaces all information supplied prior to the publication hereof.

Applications — Applications that are described herein for any of these products are for illustrative purposes only. NXP Semiconductors makes no representation or warranty that such applications will be suitable for the specified use without further testing or modification. Customers are responsible for the design and operation of their applications and products using NXP Semiconductors products, and NXP Semiconductors accepts no liability for any assistance with applications or customer product design. It is customer's sole responsibility to determine whether the NXP Semiconductors product is suitable and fit for the customer's applications and products planned, as well as for the planned application and use of customer's third party customer(s). Customers should provide appropriate design and operating safeguards to minimize the risks associated with their applications and products. NXP Semiconductors does not accept any liability related to any default, damage, costs or problem which is based on any weakness or default in the customer's applications or products, or the application or use by customer's third party customer(s). Customer is responsible for doing all necessary testing for the customer's applications and products using NXP Semiconductors products in order to avoid a default of the applications and the products or of the application or use by customer's third party customer(s). NXP does not accept any liability in this respect.

Terms and conditions of commercial sale — NXP Semiconductors products are sold subject to the general terms and conditions of commercial sale, as published at <http://www.nxp.com/profile/terms>, unless otherwise agreed in a valid written individual agreement. In case an individual agreement is concluded only the terms and conditions of the respective agreement shall apply. NXP Semiconductors hereby expressly objects to applying the customer's general terms and conditions with regard to the purchase of NXP Semiconductors products by customer.

No offer to sell or license — Nothing in this document may be interpreted or construed as an offer to sell products that is open for acceptance or the grant, conveyance or implication of any license under any copyrights, patents or other industrial or intellectual property rights.

Suitability for use in automotive applications — This NXP Semiconductors product has been qualified for use in automotive applications. Unless otherwise agreed in writing, the product is not designed, authorized or warranted to be suitable for use in life support, life-critical or safety-critical systems or equipment, nor in applications where failure or malfunction of an NXP Semiconductors product can reasonably be expected to result in personal injury, death or severe property or environmental damage. NXP Semiconductors and its suppliers accept no liability for inclusion and/or use of NXP Semiconductors products in such equipment or applications and therefore such inclusion and/or use is at the customer's own risk.

Export control — This document as well as the item(s) described herein may be subject to export control regulations. Export might require a prior authorization from competent authorities.

Translations — A non-English (translated) version of a document is for reference only. The English version shall prevail in case of any discrepancy between the translated and English versions.

Security — While NXP Semiconductors has implemented advanced security features, all products may be subject to unidentified vulnerabilities. Customers are responsible for the design and operation of their applications and products to reduce the effect of these vulnerabilities on customer's applications and products, and NXP Semiconductors accepts no liability for any vulnerability that is discovered. Customers should implement appropriate

design and operating safeguards to minimize the risks associated with their applications and products.
