

Proximity Switch

TCA 305
TCA 355

Bipolar IC

Features

- Lower open-loop current consumption; $I_S < 1 \text{ mA}$
- Lower output saturation voltage
- The temperature dependence of the switching distance is lower and compensation of the resonant circuit TC (temperature coefficient) is easier
- The sensitivity is higher, so that larger switching distances are possible and coils of a lower quality can be used
- The switching hysteresis remains constant as regards temperature, supply voltage and switching distance
- The TCA 305 even functions without external integrating capacitor. With an external capacitor (or with RC combination) good noise immunity can be achieved
- The outputs are temporarily short-circuit proof (approx. 10 s to 1 min depending on package)
- The outputs are disabled when $V_S <$ approx. 4.5 V and are enabled when the oscillator stabilizes (from $V_{S \min} = 5 \text{ V}$)
- Higher switching frequencies can be obtained
- Pb-free lead plating; RoHS compliant

Pin Configurations (top view)

The devices TCA 305 and TCA 355 contain all the functions necessary to design inductive proximity switches. By approaching a standard metal plate to the coil, the resonant circuit is damped and the outputs are switched.

Operation Schematic: see TCA 205

The types TCA 305 and TCA 355 have been developed from the type TCA 205 and are outstanding for the following characteristics:

¹⁾ TCA 305 only²⁾ Values in parenthesis apply to TCA 355 only³⁾ Operation at voltages less than 5 V (between approx. 2.5 and 5 V) is possible, if V_{REF} is connected to V_s . In this case V_{REF} is no longer internally stabilized. Additionally, the pin "turn-on delay" is to be applied as follows: If no turn-on delay is needed, this pin has to be connected to V_s . If, however, a turn-on delay is required, the charge current for D_D has to be adjusted with an external resistor between this pin and V_s (recommended value 390 k Ω ²⁾.

Application Circuit

L_0, C_0	Resonant circuit
R_{Hy}	Hysteresis adjustment
R_{Di}	Distance adjustment
D	Temperature compensation of the resonant circuit; possibly with series resistance for the purpose of adjustment. The diode is not absolutely necessary. Whether it is used or not depends on the temperature coefficient of the resonant circuit.
$R_I; C_I$	Integration element. At pin 3 (integrating capacitance) we recommend a capacitor of typ. 1 nF. To increase noise immunity this capacitor can be substituted by an RC circuit with, e.g., $R_I = 1 \text{ M}\Omega$ and $C_I = 10 \text{ nF}$.
C_D	Delay capacitor
