### 6. ISOLATION CHARACTERISTIC

Parameter	Symbol	Min.	Typ.	Max.	Unit	Test Condition	Note
Withstand Insulation Test Voltage	V <sub>ISO</sub>	5000	—	—	V	RH ≤ 50%, t = 1min, T <sub>A</sub> = 25°C	5, 6
Input-Output Resistance	R <sub>I-O</sub>	—	6.5x10 <sup>11</sup>	—	Ω	V <sub>I-O</sub> = 500V DC	5

All Typical values at T<sub>A</sub> = 25°C unless otherwise specified. All minimum and maximum specifications are at recommended operating condition. (As page 6)

#### Notes:

- 1) Maximum pulse width = 10μs, maximum duty cycle = 0.2%.
- 2) Output is sourced at -1.0A with a maximum pulse width = 10μs. V<sub>CC</sub>-V<sub>O</sub> is measured to ensure 15 V or below.
- 3) Output is sourced at 1.0 A with a maximum pulse width = 10μs. V<sub>O</sub>-V<sub>EE</sub> is measured to ensure 15 V or below.
- 4) In this test V<sub>OH</sub> is measured with a dc load current. When driving capacitive loads, V<sub>OH</sub> will approach V<sub>CC</sub> as I<sub>OH</sub> approaches zero amps.
- 5) Device is considered a two terminal device: pins 1, 2, 3 and 4 are shorted together and pins 5, 6, 7 and 8 are shorted together.
- 6) According to UL1577, each optocoupler is tested by applying an insulation test voltage 5250 V<sub>RMS</sub> for one second (leakage current less than 10uA). This test is performed before the 100% production test for partial discharge
- 7) The difference between T<sub>PHL</sub> and T<sub>PLH</sub> between any two LTV-3150-L parts under same test conditions.
- 8) Common mode transient immunity in high stage is the maximum tolerable negative dV<sub>CM</sub>/dt on the trailing edge of the common mode impulse signal, V<sub>CM</sub>, to assure that the output will remain high.
- 9) Common mode transient immunity in low stage is the maximum tolerable positive dV<sub>CM</sub>/dt on the leading edge of the common mode impulse signal, V<sub>CM</sub>, to assure that the output will remain low.
- 10) Pulse Width Distortion is defined as T<sub>PHL</sub> - T<sub>PLH</sub> for any given device.
- 11) At least a 0.1μF or bigger bypass capacitor must be connected/ closed across pin 8 and pin 5. Failure to provide the bypass may impair the switching property. Normally, it is recommended to place a 1μF multi-layer ceramic capacitor. To parallel one larger capacitor (>1μF) to optimize performance is better.
